ABSTRACT

The Mathematics Resource Project has as its goal the production of topical resources for teachers, drawn from the vast amounts of available material. This experimental edition on Ratio, Proportion, and Scaling, contains a teaching emphasis section, a classroom materials section, and teacher commentaries. The teaching emphasis section stresses ideas which may help to teach the topic, including calculators, applications, problem solving, mental arithmetic, estimation and approximation, and laboratory approaches. The teacher commentaries are intended to provide new mathematical information, give a rationale for teaching a topic, suggest alternate ways to introduce or develop topics, and suggest ways to involve students. The classroom materials are keyed to each other, to the teaching emphasis, and to the commentaries. They include worksheets, transparency masters, laboratory cards and activities, games, teacher-directed activities, and bulletin board suggestions. (MK)

FOREWORD

The demands on teachers are heavy. The fifth or sixth grade teacher with 25 to 30 students is often responsible for covering many subjects besides mathematics. The seventh or eighth grade teacher may be teaching only mathematics but be working with 125 to 150 students each day. Within this assignment the teacher must find time for correcting homework, writing and grading tests, discussions with individual students, parent conferences, teacher meetings and lesson preparations. In addition, the teacher may be asked to sponsor a student group, be present at athletic events or open houses, or coach an athletic team.

Demands are made on the teacher from other sources. Students, parents and educators ask that the teacher be aware of students' feelings, self-images and rights. School districts ask teachers to enlarge their backgrounds in mathematical or educational areas. The state may impose a list of student objectives and require teachers to use these to evaluate each student. There are pressures from parents for students to perform well on standardized tests. Mathematicians and mathematics educators are asking teachers to retain the good parts of modern mathematics, use the laboratory approach, teach problem solving as well as to increase their knowledge of learning theories, teaching strategies, and diagnosis and evaluation.

There is a proliferation of textbooks and supplementary material available. Much of this is related to the demands on teachers discussed above. The teacher in small outlying areas has little chance to see much of this material, while the teacher close to workshop and resource centers often finds the amount of available material unorganized and overwhelming.

The Mathematics Resource Project was conceived to help with these concerns. The goal of this project is to draw from the vast amounts of material available to produce topical resources for teachers. These resources are intended to help teachers provide a more effective learning environment for their students. From the resources, teachers can select classroom materials emphasizing interesting drill and practice, concept-building, problem solving, laboratory approach, and so forth. When completed the resources will include readings in content, learning theories, diagnosis and evaluation as well as references to other sources. A list of the resources is given below.

- Number Sense and Arithmetic Skills (experimental edition, 1975)
- Ratio, Proportion and Scaling (experimental edition, 1975)
- Geometry (in progress, 1976)
- Mathematics in Science and Society (in progress, 1976)
- Number Patterns and Theory
- Mathematical Systems and Sentences
- Measurement and the Metric System
- Relations and Graphs
- Statistics and Information Organization
- Probability and Expectation

INTRODUCTION

This is an experimental edition of **RATIO, PROPORTION AND SCALING**. The resource is intended to provide teachers with ideas and materials to help them in their important work which involves the minds and personalities of their students.

WHAT IS IN THIS RESOURCE?

The *Teaching Emphases* section stresses important areas which may help to teach most topics. These include:

Calculators

Applications

Problem Solving

Mental Arithmetic

Estimation and Approximation

Laboratory Approaches

The *Classroom Materials* section includes:

- Paper and pencil worksheets
- Transparency masters
- Laboratory cards and activities
- Games
- Teacher directed activities
- Bulletin board suggestions

The *teacher commentaries* which appear before the subsections of the classroom materials intend to:

- Provide new mathematical information (historical, etc.)
- Give a rationale for teaching a topic
- Suggest alternate ways to introduce or develop topics
- Suggest ways to involve students
- Highlight the classroom pages
- Give more ideas on the teaching emphases

HOW ARE THE IDEAS RELATED?

The classroom materials are keyed to each other within the section, to the teaching emphases and to the commentaries with symbols and teacher talk as shown on the next page.

The commentaries refer to specific classroom pages (cited in italics) and often a classroom page is shown reduced in size next to the discussion of the page. The commentaries relate the various teaching emphases to the mathematical topic of that subsection.

Each teaching emphasis includes a rationale, highlights from the classroom materials and a complete list of classroom pages related to that emphasis.

HOW CAN THE RESOURCE BE USED?

Each teacher will decide which material is appropriate for his/her students. The importance of the teacher's role in making these decisions cannot be emphasized strongly enough. A teacher might use a few of the paper and pencil worksheets to supplement the textbook, use the laboratory activities to give more "hands-on" experience, or organize a unit around a teaching emphasis. Thus, the resource can serve as a springboard to develop a more flexible mathematics curriculum. More importantly, the teacher can supplement the resource with his/her own ideas to build a dynamic instructional program.

PAGE FEATURES

When a ditto master is made using the thermofax process, the material in blue will not reproduce. Thus, the student's copy will contain only the material printed in black. The corners are designed to describe the content on each page.

The symbols below identify the teaching emphases in this resource. Each of these is discussed in the section *Teaching Emphases*.

Calculators

Applications

Problem Solving

Mental Arithmetic

Algorithms

Estimation and Approximation

Laboratory Approaches

Enrichment (involving investigations or extensions of mathematical topics)

Skill-building (involving self-correcting pages and applications)

Introduction (using concrete or semi-concrete models to introduce concepts and meanings)

These are the main topics covered on this page.

?

OMAR'S DILEMMA

Addition/Subtraction
Whole Numbers

FATIMA, OMAR'S WIFE, SENT HIM TO THE WELL TO GET EXACTLY ONE LITRE OF WATER. HOWEVER, HE HAD ONLY A 5-LITRE JUG AND A 2-LITRE JUG. CAN YOU HELP OMAR FIGURE OUT HOW TO GET EXACTLY 1 LITRE?

There are at least two solutions. Here is one: Fill 5-litre jug, pour 2 litres in the 2-litre jug, empty 2-litre jug and fill it again from the 5-litre jug. Leaving 1 litre in the 5-litre jug.

The problem can also be done using a 5-litre jug and a 3-litre jug or other combinations.

WHICH OF THE FOLLOWING AMOUNTS OF WATER CAN HE CARRY HOME USING ONLY HIS 5-LITRE AND 2-LITRE JUGS?

1 l, 2 l, 3 l, 4 l, 5 l, 6 l, 7 l, 8 l

WHAT AMOUNTS OF WATER CAN BE OBTAINED USING ONLY 3 l, 5 l, AND 11 l JUGS?

SEE IF YOU CAN FIND THREE JUGS THAT WILL MEASURE AMOUNTS FROM 1 LITRE TO 20 LITRES USING NO OTHER CONTAINERS!

COULD YOU HAVE USED ONLY TWO JUGS?

NOTE: Paper & Pencil/Transparency

This could be a good small group activity in which students can interact and discuss possible solutions.

Here is the *type* of activity. This refers to the suggested use of the page.

Credit is given here to the *source* if the page is a direct copy. *Ideas* from other sources are also noted.

TEACHING EMPHASES

CALCULATORS

RATIONALE

As early as the seventh century B.C. the counting board or abacus was invented and used for simple whole number computations. Merchants and traders of ancient times probably would have found the abacus cumbersome to carry around in their back pocket. If they were alive today, they could not only have a calculator in their pocket but they might have a computer terminal in their briefcase! Electronic calculators are one of the hottest selling items around the world. They are becoming as popular and inexpensive as watches. They give instantaneous effortless answers to many computations. They are small, quiet and cheap.

Using a calculator is relatively easy. You push a few buttons in sequence and "Voilà!" the keyboard display flashes the answer. "Most of us have so far explored numberland by the very laborious, manual route. The hand calculator lets you travel by automation, and explore far afield effortlessly." [Wallace Judd] Paper and pencil calculations are often slow, inaccurate and tiresome. Interest and enthusiasm for mathematics is often killed by such drudgery. The calculator becomes a fantastic tool that frees us to do investigations and problem solving. Its speed allows us to keep pace with our racing minds as we search for solutions, conjectures, and more questions.

The electronic calculator is NOT a fad; it is here to stay. Like the radio and television, soon everyone may own one (or two or three). The calculator is bound to change our way of life just as other advances in technology have. Already educators are arguing about the use of the calculator in the mathematics classroom. Should the calculator be used when teaching arithmetic skills in elementary schools? Will children need to memorize addition and multiplication facts if they learn to compute using a calculator? Will senior high students need to learn how to use logarithmic tables or should they use an electronic calculator instead? In other words, the whole mathematics curriculum from kindergarten through college will need to make serious adjustments to account for the use of the electronic calculator. Because the calculator is becoming available to all members of our society, including children, educators will need to decide how electronic calculators fit into the school curriculum.

Recently, pocket or desk calculators have been used in mathematics classrooms to motivate students and expand their ability to solve "messy" real-world problems (i.e., stock investments, tax forms, interest on car payments, pollution controls). The calculator provides the immediate feedback of answers and a problem-solving flexibility that

encourages the student to become involved in complex computations. However, one needs to be careful! Most calculators do not retain and display all the numbers or operations entered. If wrong numbers are entered or operations are entered in the wrong order (a faulty algorithm sequence), the incorrect answer must be recognized by the student. To tell a reasonable answer from an unreasonable one, a student needs to know how to compute using the basic arithmetic facts, how to round numbers, how to estimate and approximate answers, and how to place a decimal point. Arithmetic skills and number sense are very important if the hazards of a calculator are to be avoided. The calculator does not replace thought processes. It is a tool that saves time and energy and frees us to think and do mathematics above the computational level.

SUMMARY

- I. Calculators fit into the classroom in different ways:
 1. Non-electric calculators (abacus, etc.)
 - a. teach concepts in counting, place value, and arithmetic computations, and
 - b. demonstrate algorithms for solving computational problems.
 2. Electronic calculators free the students from tedious pencil and paper calculations. They allow the student to . . .
 - a. speed up "messy" calculations, and
 - b. investigate and work on mathematical problems and applications that would otherwise involve long, unmanageable calculations.
- II. The teacher can prepare students for electronic calculators by . . .
 1. Emphasizing estimation and approximation skills which are vital in checking answers and placing the decimal point correctly.
 2. Teaching the student to determine the reasonableness of exact answers by approximate calculations.
 3. Introducing situations and problems where the hand calculator is an obvious aid to cumbersome, time-consuming calculations.
 4. Asking students what types of mistakes can be made while using the calculator.
- III. Teachers can prepare themselves for using the electronic calculator in instruction by . . .
 1. Experimenting with it themselves. (Let the students see the teacher using a calculator.)
 2. Reading current periodicals and checking the mathematics publication companies for new "calculator" books. (There is currently no body of knowledge about how to use a calculator in the classroom.)
 3. Having an open mind about the use of the calculator before deciding that the calculators will be a "cure-all" to teaching computation, or that they should be banned from the mathematics curriculum.

EXAMPLES OF CALCULATOR PAGES FOUND IN THE CLASSROOM MATERIALS

I. Electronic Calculators

I NEED A JOB LIKE THAT!

Mr. Pennypusher, I have a 20-day job for you to do, but I cannot pay you very much.

That's ok, Mr. Pushover. How about paying me 1 penny the first day, 2 pennies the second day, 4 pennies the third day, 8 pennies the fourth day, and so on for the 20 days?

Sounds like a good deal to me.

Yes, it is a good deal.

For me? Not! Not!

Fill in this chart of earnings for Mr. Pennypusher. Use a calculator to get each day's wages and the total earnings for all 20 days.

DAY	EARNINGS	DAY	EARNINGS
1	\$	11	\$
2	\$	12	\$
3	\$	13	\$
4	\$	14	\$
5	\$	15	\$
6	\$	16	\$
7	\$	17	\$
8	\$	18	\$
9	\$	19	\$
10	\$	20	\$
TOTAL FOR 20 DAYS		\$	

a) What is the average amount Mr. Pennypusher made per day? (Divide the total earnings by 20.)

b) If he worked 8 hours per day, what is the average amount he made per hour?

c) How much did Mr. Pennypusher average per minute?

d) If you were paid as much as Mr. Pennypusher averaged per minute, how much would you make for the time you are in your mathematics class?

per day? _____

per week? _____

per school year? _____

Simple and compound interest have easy formulas, but messy, repetitive computations that can be handled very efficiently by the electronic calculator.

Multiplying and adding large numbers can be frustrating and painful to do manually. The electronic calculator provides quick answers; then basic conclusions can be drawn from the data.

CERTAIN GROWTHS ARE BENEFICIAL

Many kinds of growth occur and are studied in mathematics. Some involve growth by a fixed amount, some by a fixed rate. These two can produce surprisingly different results.

Have students compute the outcome of depositing \$1000 at a bank at a 5% interest rate compounded annually for 20 years and compare it with a deposit of \$1000 increased annually by a fixed amount of interest (\$50.00 = 5% of \$1000) for 20 years.

Tables could be used to organize the results, and a hand calculator would simplify the computation. Interest payments should be rounded to the nearest cent.

COMPOUND INTEREST (fixed rate)				SIMPLE INTEREST (fixed amount)		
Age of deposit in years	Amount at beginning of year	Interest at 5%	Amount + Interest	Age of deposit in years	Amount at beginning of year	Fixed amount of interest credited each year
1	\$1000.00	\$50.00	\$1050.00	1	\$1000.00	\$50.00
2	\$1050.00	\$52.50	\$1102.50	2	\$1050.00	\$50.00
3	\$1102.50	\$55.13	\$1157.63	3	\$1100.00	\$50.00
4	\$1157.63	\$57.88	\$1215.51	4	\$1150.00	\$50.00

Discuss the two outcomes. In the first table the amount of growth each year shares in the growth during the next year.

Suppose that the interest is compounded semi-annually or quarterly. What effect would this have? Some banks compound interest continuously. What does this mean? Investigate the savings plans offered at banks and savings and loan. Which would be the best for short term deposits? Long term deposits?

In the bank compound interest amounts are calculated from the formula $A = P(1 + \frac{r}{n})^n$ where P is the amount of simple interest, r is the time period in years, n is the number of compounding periods in a year. By the use of the formula it can be shown that the effective annual yield of a 7% savings certificate compounded daily for a 365-day year is 7.26% ($A = P(1 + \frac{.07}{365})^{365} = 1.0726$).

If compounded continuously, the formula used is $A = Pe^{rt}$ where e is the base of natural logarithms. $A = e^{.07 \times 1} = 1.736$, an effective annual yield of 7.36%. Thus, a 7% certificate could yield 7.26% or 7.36%.

When measuring and recording data, the calculator is a welcome assistant for analyzing results and making quick numerical comparisons.

ONLY THE SHADOW KNOWS

Materials needed: 2 students, a book, a metre stick, a metric tape measure, charts for recording data, metre wheel (optional).

① Before going outside to measure shadows, measure each height to the nearest centimeter and record the data on the chart.

Name	Height of Object	Length of Shadow	Ratio of Height to Length
a) Student A			
b) Student B			
c) Book			
d) Metre Stick			

② Go outside and measure the shadows. For the students measure from the heel as they face the sun. Record the data in the chart. Write the ratios in simplest form. Are the ratios equivalent?

You may need my help, too.

③ Find some objects too tall to measure directly. Measure these shadows correct to the nearest decimetre. Some objects are suggested in the chart to the right. There is space for you to include other objects. Wait until you are back in the classroom to compute the heights. A calculator can help you.

Object	Height of Object	Length of Shadow
Flagpole		
Short tree		
Tall tree		
Goalpost		
Telephone pole		

④ To find the heights of the objects in the second chart, use the ratio from the first chart, set up a proportion, and solve.
For example:

Lonnie	150 cm	200 cm	$\frac{150}{200} = \frac{3}{4}$
Tall tree	24 dm	168 dm	

⑤ Find the heights of the objects in your chart. Compare your results with other groups. Are they the same? What information in the charts will change if this activity is done at a different time of day?

II. Non-Electronic Calculator

This calculator can be used as a visual learning aid. The student sees percents actually being computed through the use of the simple paper model.

RATIONALE

Over 2000 years ago man developed number symbols, arithmetic calculations and geometry to describe and record real-world happenings. Mathematics was used to solve the problems of merchants, scientists, builders and priests.

About 600 B.C. Greek mathematicians took a different approach. They began studying numerical patterns and geometry for their aesthetic qualities. Mathematics became an intellectual exercise with no necessary applications in mind. The development of mathematics was soon traveling in two directions: practical or applied mathematics, originating from the Egyptians, and "pure" mathematics, originating from the Greeks.

Practical and "pure" mathematics are not always separable. One often inspires and directs the other; they become interwoven. As a result, applications of mathematics fall into three categories:

- 1) applications to real-life situations such as business, finance, sports, polls and census taking
- 2) applications to other disciplines (i.e., science, music, art)
- 3) applications to other branches of mathematics (problem-solving activities in the realm of "pure" mathematics)

The Egyptians, for example, were interested in learning as much as they could about their environment and how to control it. Today we are also curious

about the rapidly changing environment we have created. Because of the complexity of our culture and its emphasis on technology, mathematics is very important to us in our jobs, in our daily living and in our future.

We face many problems in our daily living. Since all problems require the collection of information before solutions can be found and analyzed, mathematics is often a helpful tool in solving problems; yet few people relate mathematics to real-life situations or real-life situations to mathematics.

Many teachers have neglected to teach applications of mathematics for a number of reasons:

- 1) "I have little background in applications of mathematics."
- 2) "My students often have little or no background in science, art, music and other disciplines."
- 3) "Applications require elaborate equipment and preparation."
- 4) "My students are not interested in applications."
- 5) "Good applications take too much time to teach. There is plenty to teach in the math textbook."
- 6) "How can my students apply mathematics when they do not even have basic computational skills?"

Yet educators and the public agree that applications of mathematics are very important and should be taught in the mathematics classroom. Society is demanding accountability and relevancy in our education system. Students need

ample opportunity to experience mathematics in a practical sense so that they will be better equipped to apply it as adults.

Even though certain applications of mathematics require special equipment and materials, much of this equipment can be constructed from inexpensive substitutes and common materials. Once the equipment is collected or made, it will last for years. Also, various applications can be adapted to fit available materials and equipment.

Applications should include appropriate topics and activities. Here are a few questions to consider when choosing an application of mathematics:

- a) Is it interesting to the students and the teacher?
- b) Does it start at the appropriate skill level?
- c) Does it extend and develop the computational and/or problem-solving skills of the students?
- d) Does it include topics, skills or ideas which might help the students contribute to society and deal with real-life situations?
- e) Could it be done as a laboratory activity?
- f) What concepts does it imply and develop?

Selected Sources for Applications

Information Please Almanac Atlas and Yearbook, Dan Golenpaul Associates, 1975 (or current yearbook).

Jacobs, Harold R. Mathematics--A Human Endeavor, W.H. Freeman and Co., 1970.

- g) How much time would it take to teach?
- h) What equipment and materials are needed or available?

SUMMARY

1. Applications of mathematics fall into three categories:
 - a) applications to real life situations
 - b) applications to other disciplines, and
 - c) applications to other branches of mathematics.
2. Down through the centuries, mathematics has been a useful tool for solving real work problems and analyzing our environment.
3. Even though many teachers have neglected to teach applications of mathematics, our complex society demands that public education teach practical mathematics and problem-solving techniques.
4. Mathematics can be used to solve problems in the real world and in other disciplines.
5. Applications to real life situations and other subject areas (i.e., physics, social science, economics, art, music) make abstract mathematics more meaningful and understandable.
6. Applications should include appropriate, interesting topics and activities for students and teachers.

EXAMPLES OF APPLICATIONS FOUND IN THE CLASSROOM MATERIALS

I. Real-World Applications

From sport events to grocery shopping to government spending, we are exposed to applications of mathematics. If we know how to work with numbers and mathematical ideas, we can often use mathematics to help us deal with real-life situations.

BUT ONLY WANT ONE

Find the unit cost (cost of one item):

A. 3 tennis balls cost \$2.67

B. 2 dozen pencils cost \$1.68

C. a 6-pack of pop cost \$1.14

D. 1 dozen eggs cost \$.96

E. 3 T-shirts cost \$3.36

F. 5 pounds of hamburger cost \$3.45

Find the better buy by finding the unit cost, for example cost per ounce.

G. 12 oz. of soap for \$1.32 or 15 oz. for \$1.50

H. 10 oz. of potato chips for 80¢ or 16 oz. for \$1.12

I. \$7.55 for 5 lbs. of steak or \$4.50 for 3 lbs. of steak

J. 4 qts. of milk for \$1.24 or 7 qts. of milk for \$2.24

K. \$20.98 for 2 pairs of jeans or \$31.77 for 3 pairs of jeans

Unit pricing is frequently posted below the items sold in grocery and department stores for the convenience of the customer. As a consumer we can develop an awareness of prices and quality. Compare prices by finding the unit cost and determine which item is the better buy.

Physical fitness is measured, in part, by one's body proportions. Once standard growth patterns are tabulated and verified, the average height and weight of a person at a given age provides a measure for comparison.

what's YOUR TYPE

1. Weigh yourself and measure your height. _____ pounds _____ inches
2. Change your weight to kilograms.
1 pound $\approx$.45 kilograms.
3. Change your height to centimetres. (1 inch $\approx$ 2.5 centimetres)
4. Use the chart to determine your body type.

45 kilograms = ?
1 pound = your weight

Weight in kilograms
Height in centimetres

5. Sue is 15 years old, weighs 127 pounds, and is 5 feet, 7 inches tall.
 - a) Find her weight in kilograms.
 - b) Find her height in centimetres. (Hint: 12 inches = 1 foot)
 - c) What is her body type?
6. John is 11 years old, weighs 65 pounds, and is 53 inches tall.
 - a) Find John's weight in kilograms.
 - b) Find John's height in centimetres.
 - c) What is his body type?
7. Fred is 14 years old, weighs 120 pounds, and is 65 inches tall.
 - a) Guess his body type.
 - b) Check your guess by changing Fred's measurements to metric.

LIMIT YOUR SPEED
(Continued)

STOPPING DISTANCES OF STANDARD PASSENGER CARS

MILES PER HOUR	DRIVER REACTION DISTANCE FT.	BRAKING DISTANCE FT.	TOTAL STOPPING DISTANCE FT.
20	22	18-22	40-44
30	33	36-45	69-78
40	44	64-80	108-124
50	55	105-131	160-186
60	66	162-202	228-268
70	77	237-295	314-372
80	88	334-418	422-506

The distances in the table are based on tests given on dry, level ground. Stopping distances increase when the road is wet, snowy, or icy.

1 foot = .3 metre
1 mile = 1.6 kilometres

11. If you are driving at a speed of 30 kilometres per hour, could you stop the car in 24 metres?

12. If you are driving at a speed of 48 kilometres per hour, how close can you safely follow another car?

13. If a driver's reaction time is about 20 metres, his speed is about _____ kilometres per hour.

14. If both drivers hit their brakes, will the two cars crash?

From Eratosthenes who determined the circumference of the earth to Boy Scouts determining the height of a cliff, the use of indirect measurement is a useful application of mathematics.

The automobile is one of the main means of transportation. Each state requires that a motorist pass a driver's test and obey certain rules of the road, especially speed limits. Automobiles and the problems they create are frequently discussed by students since riding in a car and being conscious of driving skills are experiences they all have in common.

ONLY THE SHADOW KNOWS

Materials needed: 2 students, a book, a metre stick, a metric tape measure, charts for recording data, metre wheel (optional).

Name	Height of Object	Length of Shadow	Ratio of Height to Length
a) Student A			
b) Student B			
c) Book			
d) Metre Stick			

1. Before going outside to measure shadows, measure each height to the nearest centimeter and record the data on the chart.

2. Go outside and measure the shadows. For the students measure from the heel as they face the sun. Record the data in the chart. Write the ratios in simplest form. Are the ratios equivalent?

You may need my help too!

Object	Height of Object	Length of Shadow
Flagpole		
Short tree		
Tall tree		
Gonipost		
Telephone pole		

3. Find some objects too tall to measure directly. Measure these shadows correct to the nearest decimetre. Some objects are suggested in the chart to the right. There is space for you to include other objects. Wait until you are back in the classroom to compute the heights. A calculator can help you.

4. To find the heights of the objects in the second chart, use the ratio from the first chart, set up a proportion, and solve.
For example:

Lonnie	150 cm	200 cm	$\frac{3}{4}$
Tall tree	200 cm	48 cm	

5. Find the heights of the objects in your chart. Compare your results with other groups. Are they the same? What information in the charts will change if this activity is done at a different time of day?

II. Applications to Other Subject Areas

A "basic working knowledge" of mathematics is often required for the study and mastery of various subjects. Science, music, art, geography, computer science and many other disciplines use mathematics in the formulation of their research problems and applications.

Plants are an important part of our environment. Number patterns, such as the Fibonacci sequence, mathematically describe the natural appearance of plants.

RABBITS, PLANTS AND RECTANGLES
ACTIVITY II

The Fibonacci numbers: 1, 1, 2, 3, 5, 8, ... have many interesting properties and appear in many places in nature.

What do you notice about the number of petals in these flowers?

Check the flowers in your own garden. Count the petals. Are any of the numbers Fibonacci numbers?

When new leaves or twigs grow from the stem of a plant, they spiral around the stem. Select one leaf as a starting point and count up the stem leaf by leaf until you reach a leaf that is directly above the starting point. Record the number of leaves and the number of turns taken around the stem in counting the leaves. What do you notice about these numbers?

The result is often stated as a ratio: $\frac{\text{number of turns}}{\text{number of leaves}}$.

The beech tree has a ratio of $\frac{5}{8}$; the pussy willow is $\frac{8}{13}$.

Examine the pictures above and write the ratio for each tree.

Check a cornucopia. What is its ratio?

Fibonacci numbers also occur in nature in the number of spirals in the seed patterns of sunflowers and scale patterns in pine cones and pine-apples. Check the photograph and diagram of a pine cone.

The geography of the United States and the transportation systems are important to anyone traveling around the U.S.A. Thinking of distance in kilometres is a new experience for most Americans.

kilometouring around the USA.

Use the map on the next page. Measure the distance between the following cities to the nearest half centimetre. On the map 1 cm represents 100 km. Figure out the actual distance in km between the cities. The first one is done for you.

- 1 Reno, Nevada to New York City 18.5 cm 1850 km
- 2 Seattle, Washington to Miami, Florida _____ cm _____ km
- 3 St. Paul, Minnesota to Houston, Texas _____ cm _____ km
- 4 Los Angeles to Cleveland, Ohio _____ cm _____ km
- 5 Butte, Montana to Rapid City, SD _____ cm _____ km
- 6 Washington, D.C. to St. Louis, MO _____ cm _____ km
- 7 Denver, Colorado to Raleigh, NC _____ cm _____ km

1 cm represents 100 km

III. Miscellaneous Applications

The need for certain mathematical concepts and tools may arise naturally in the context of various situations. The teacher can provide interesting activities that arouse the students curiosity whether they are real-world problems or not.

A Pen For Your Pencil

Materials needed: Ruler
Protractor
Tape
Poster board

Activity:
From the scale drawing of the pieces that make the pencil container, decide how much poster board you need.

Carefully draw the outline of the bottom, full size. Measure the drawing and use the scale. The bottom is a hexagon with equal sides and equal angles. Cut the bottom out of the poster board.

In the same way make 6 identical side walls from the poster board.

Arrange the pieces as they are in the scale drawing. (You should have three side walls leftover.) Tape each side wall to the bottom. Make sure there is almost no space between the edge of the bottom and the edge of each wall.

Bend two side walls up and tape them together along the edge where they touch. Bend up the other sides, one at a time, and tape them in place.

Tape the remaining three side walls together to make a three-pocket divider for the container. Place it in the container along the dotted lines of the scale drawing.

Decorate your pencil container.

From a scale drawing the student constructs a hexagon-shaped container. The student uses skills in measurement (ruler and protractor) and visual perception while working on this activity.

These short story problems deal with percents that are smaller than 1%. Situations are presented to provide meaning and understanding.

PUNY PERCENTS

2) $\frac{1}{10}\%$ of all eggs are rejected. 20,000 have been checked. _____ eggs are rejected.

$\frac{1}{10}$ for every 100
1 for every _____
_____ for every 20,000

1) In 1973 about 400 auto thefts were reported for every 100,000 people. What percent of the population had cars stolen?

400 for every 100,000
4 for every _____
_____ for every 100

6) A $\frac{1}{6}$ -cup serving of rice has $\frac{1}{2}\%$ of the minimum daily requirement of Vitamin C. How many cups would you have to cook in order to have enough Vitamin C for one day? _____

7) Many clothing labels say, "Less than 1% shrinkage." If the actual shrinkage is $\frac{1}{2}\%$, how much is lost if you wash 100 yds. of cloth? _____

PROBLEM SOLVING

RATIONALE

Learning to solve problems is probably the most important aspect of one's education. No matter who we are, where we live, or what we do, there will always be problems for us to face and problems for us to solve if we want to solve them. Sometimes it is not easy to determine whether a situation really is a problem for a particular individual. What is a problem to one person may be an exercise to another. Performing or practicing something (a task) that one already knows how to do is an exercise. Therefore, the task may require only a routine procedure which leads to the solution(s). However, if the individual has a clearly defined, desired goal in mind, but the pathway to the goal is blocked, then the individual has a "problem" to solve. "A true problem in mathematics can be thought of as a situation that is novel for the individual called upon to solve it. It requires certain behaviors beyond the routine application of an established procedure." [Troutman and Lichtenberg]

Mathematics teachers should pose and provide problems that have no obvious method or algorithm to follow in reaching a solution. Too often students are given page after page of various computational exercises which use one or more "essential" algorithms the students have

"memorized." Once outside the classroom, students rarely use the algorithms they have memorized because the algorithms do not seem applicable. They come across ambiguous, disorganized situations that require considerable thought and skill for making a decision or finding a reasonable solution. Developing the ability to think independently and make wise decisions will help people to solve future problems by themselves.

Problem solving is a structured process. George Polya, in his book How to Solve It, divides the problem solving process into four steps:

- 1) Understanding the problem.
- 2) Devising a plan.
- 3) Carrying out the plan.
- 4) Looking back and checking the results.

Other authors have discussed the problem solving process with similar steps that match or fit into Polya's four steps (see Selected Sources for Problem Solving). These steps provide a structure which guides the problem solver through a search for the solution(s) to a problem. In the discussion which follows, several questions to answer and "things to try" are given under each of the four steps.

Understanding the Problem:

1. State the problem in your own words. (If the student cannot read the problem well enough to understand its meaning, the teacher may need to

read it to him. If the student can read but does not understand the problem, the teacher could rephrase the problem. The teacher should check for stumbling blocks. If the student has read the problem but seems bothered, ask what he thinks about the problem. Perhaps the student sees the situation as unrealistic, inconsistent or incomplete.)

2. What are you trying to find out? What is the unknown?
3. What relevant information do you get from the problem?
4. Is there any information that is not needed to solve the problem?
5. Are there any missing data that you need to know to solve the problem?
6. Are there any diagrams, pictures or models that may provide additional information about the problem?
7. Can you try some numerical examples?
8. Is it possible to recreate, dramatize, or make a drawing of the problem?
9. Can you make an educated guess as to what the solution(s) might be?

Devising a Plan:

1. Make a diagram, number line, chart, table, picture, model or graph to organize and structure the data.
2. Guess and check. Organize the trial and error investigations into a table.
3. Look for patterns.
4. Translate the phrases of the problem into mathematical symbols and sentences.
5. Try to solve one part of the problem at a time (i.e., break the problem into cases).
6. Have you worked a problem like this

before? What method did you use?

7. Can you solve a simpler but related or analogous problem?
8. Keep the goal in sight at all times.

Carrying Out the Plan:

1. Keep a record of your work.
2. Perform the steps in your plan; check each step carefully.
3. Complete your diagram, chart, table or graph.
4. Follow patterns; organize and generalize them.
5. Compare your estimates and guesses with your work.
6. Solve the mathematical sentence; record the calculations and answer.
7. Work out any simpler but related or analogous problems. Compare the solutions.

Looking Back:

1. Can you check your result? Is the answer reasonable?
2. What does the result tell you? What conclusions can be made?
3. Is there another solution? Is there another way of finding the answer?
4. Make up some problems like the one you worked. Is there a rule or generalization that can be used to solve similar problems?
5. What method(s) helped you get the answer(s)?

Teaching Problem Solving

"The best way to learn problem solving is by working problems and studying the processes we used in working them."

[Hints for Problem Solving] If a person is going to become a problem solver, he/she will need to be involved in a

variety of problem-solving experiences. Before any problem can be tackled, there has to be the desire to solve the problem. The teacher can motivate the students by giving them problems within their range of experience and interests. Stimulating questions can guide the students through the problem-solving process. Getting the students to the point where they WANT to solve the problem is the most important step that will lead to successful problem solving. To further insure the success of a problem-solving activity, the teacher should stress a thorough understanding of the problem and encourage students to devise and carry out their own plan for finding the solution. It is important to provide all students with enough time to arrive at the solution independently without the faster students blurting out their solutions.

In the beginning the teacher should realize that most students are NOT problem solvers. They become frustrated quickly and tend to give up easily. They often make incorrect conjectures and fail to check the reasonableness of their answers. They lack a knowledge of problem-solving techniques and the ability to use them. Some students have not acquired the necessary computational skills or reading/comprehension skills needed to carry out the problem-solving process.

No teacher or student has to memorize Polya's four steps and its list of "things to try," but there are specific skills from the list that can be the focus of a lesson. Some activities, such as *Patterns for Introducing Ratio*, *Ratio of Ages* and *Proportions with a Plank*, have specific patterns to follow when finding the solution and then finally arriving at a generalized solution. Other activities like *Poppin' Wheelies in a Ring*, *Surface Area and Ratios 2*, *Percent with Cubes*, *The Percent Painter Returns* and *Scaling a Skyscraper* all use manipulatives or cubes to build models of each situation. These activities using visual aids encourage active participation by the students who often have little confidence in their ability to tackle a problem-solving situation. Many of the specific problem-solving suggestions discussed earlier can be tried and applied while working the problem-solving activities found in the classroom materials.

Why Teach Problem Solving?--A Final Argument

". . . In the minds of all but a few college freshmen, problem solving is not a process by which one ascertains the truth. Rather, it is a process by which one gets the answer in the back of the book by a sequence of steps, each of which has been authorized by

the teacher." (Edwin E. Moise, Siam News, Feb. 1975) Indeed, too many mathematics assignments do require rote procedures to be followed while finding the same answer as the "answer in the back of the book," but this is really drill and practice, not problem solving, and the students are doing exercises, not problems.

If our students are to become

independent thinkers and problem solvers, it is important that we give them many situations which cannot be routinely solved. It is important that we as educators provide guidance and examples that involve a variety of problem-solving techniques. Problem solving is a process of thinking that "emancipates us from merely routine activity."

EXAMPLES OF PROBLEM SOLVING FOUND IN THE CLASSROOM MATERIALS

I. Manipulatives and Models

Manipulatives and models enhance the understanding of the problem. They provide a representation of the situation, creating visual and physical feedback that is often necessary in the search for a solution.

The Spirograph creates many exciting patterns. How does it work? The wheels and rings move together in ratios to create intricate designs.

Poppin' Wheels In A Ring
(continued)

Use the information in the table to draw more shapes. Before you start drawing, try to decide how many loops the shape will have and how many times the wheel will have to go round the ring before the pattern is repeated. You select the ring and wheel sizes for the last experiment.

Teeth on ring	Teeth on wheel	Loops on shape	Number of times wheel goes around ring before pattern repeats	Teeth on ring	Teeth on wheel	Simplified Ratio
96	32			96:32		3:1
96	24					
96	72					
105	75					
96	48					
105	45					
96	56					

Can you explain why you have to go around the inside of the ring a number of times to complete some shapes and why a certain number of loops appear?

- (1) Predict how many loops you will get with the 105 ring and the 60 wheel. Check your answer by drawing the shape.
- (2) Use the 96 ring. Which wheel would you use to get a shape that has 18 loops if the wheel goes around the ring 7 times before the pattern repeats?
- (3) Draw some more shapes. Predict how many loops each shape will have before you draw it.
- (4) Look at the shape on the right. It was made using a 96 ring. By counting the loops, can you decide which wheel was used?

Examine the two rings in the set. Both have many numbers on them. One ring has 96 and 144. This means there are 96 teeth on the inside of the ring and 144 on the outside. Look at one of the wheels. The largest number tells you how many teeth it has.

- (1) Use the 96 ring and the 32 wheel. Draw a pattern with it.
- (2) How many loops are there on the shape?
- (3) How many times must the wheel go around the inside of the ring before the pattern begins to repeat?

Using 100 cubes and a calculator, a percent model can be investigated. By observing the patterns found, one can predict and perhaps generalize what happens in similar problems.

Materials: 100 cubes and a calculator

Activity:

- 1) Build a 10 x 10 model with the cubes. If the entire model is painted
 - a) What percent of the cubes will have 4 faces painted? _____
 - 3 faces painted? _____
 - 2 faces painted? _____
- 2) Build a 9 x 9 model.

- 3) Build an 8 x 8 model.

	number	%
4 faces painted	4	5
3 faces painted	28	
2 faces painted		
Total		

Write the answer to the nearest percent.

	number	%
4 faces	4	
3 faces		
2 faces		
Total		

Students learn to interpret a model or drawing by experiencing problem situations that involve its use. Sometimes students will solve a problem more readily if they build a scale model or look at a drawing of the situation.

SCALING SEVERAL SKYSCRAPERS

Use a scale of the edge of a cube : 5 metres to answer these questions.

	#1	#2	#3
1) How long is each building (front)?	_____	_____	_____
How wide is each building (side)?	_____	_____	_____
How tall is each building?	_____	_____	_____

2) A window washer is working on the front of building #2, 20 metres from the top and 10 metres from building #1. Put an x to show the window washer.

3) Another window washer is on the side of #3, 20 metres from the sidewalk and 17.5 metres from building #1. Put an x to show him.

II. Research Problems

Research is a fundamental process that all disciplines use to gain and expand knowledge in their fields. Situations are encountered where the answer is not known. Unless one performs some experiments, gathers data and, in general, does some research, the answer may never be clear, not even with educated guessing.

Which letters of the alphabet occur most frequently in printed materials? How can we find out?--do a little research and compile the results. Use the information to create your own "Morse code" and compare it to the real Morse code.

WHO'S #1?

Which letter of the alphabet occurs most frequently in printed material?

(The following is written as an individual activity but can be done in a two-person group.)

- Each student chooses a book.
- Each student then selects five lines of print and keeps a tally to count how many times each letter occurs. If graph paper is used, and a square shaded for each occurrence of a letter, a bar graph will be constructed.

- To compile the results several methods can be used.
 - Each student can report his most frequent letter to the class, and a tally on the blackboard can be kept.
 - A large bar graph can be constructed on the bulletin board, and each student can shade in his results. The large bar graph may need to be scaled to make the size manageable.

Set up an experiment and record weight and distance in a table. What patterns are noticed after the data is recorded? Is there a relationship between the weights and distances?

Proportions with a PLANK

Materials needed: Ten-foot plank, four-inch concrete building block, bathroom scale, measuring tape, metre or yard stick.

- I. Balance the plank by placing the block in the middle. Ask for a volunteer (or the teacher) to stand on one end of the plank. Have different members of the class try to balance the plank by standing on the opposite end. For the plank to balance students should realize the weights of the volunteers should be about equal. Weigh the volunteers.
- II. Pick two members of the class having different weights. Weigh them and record the weights. Keep the block in the middle and ask them to stand on opposite ends of the plank and balance each other. Students will probably use their previous experience with teeter-totters to accomplish the task.
- III. Again pick two members of the class having different weights. This time their task is to stand on the ends of the plank and balance it by moving the block.
- IV. Have the students use the three activities above to formulate a conjecture about how a balance occurs. Students will probably say that the heavier weight is closer to the block, and the lighter weight is farther away from the block.
- V. Ask students to examine the relationship between the weights and distances by completing a table. By using two students whose weights are considerably different, a pattern can be discovered. The results in the last column will be approximately equal.

Weight of person (w)	Distance w is from block (D)	W × D	W × D	W × D	W × D

The General Rule is : $W_1 \times D_1 = W_2 \times D_2$, or $\frac{W_1}{W_2} = \frac{D_2}{D_1}$.

III. Miscellaneous Problem Solving

These "petite" story problems give common situations that use numbers and proportions. The format of the problem makes the proportion easy to identify.

CHOOSE THE SCALE

A bulletin board display could give students practice in associating reasonable scales with pictures or scale drawings. Pictures from magazines, maps, xerox copies from textbooks, etc. could be attractively arranged on the bulletin board, and the corresponding scales posted separately. String could be used for students to match each scale with the corresponding graphic or the scales could be moved and placed next to the appropriate graphic. For several days discussions and changes on the bulletin board should be entirely student-centered. To close the activity the teacher could have a class discussion of the final choices. Thus, the bulletin board can be used as an active learning tool.

PETITE PROPORTIONS 2

1) 2 dozen for \$1.68,
5 dozen for ____.

2) 24 pencils for 88c,
18 pencils for ____.

3) 6 cans of peas for \$1.80,
9 cans of peas for ____.

This sample bulletin board display associates a reasonable scale with its corresponding drawing or picture. A brief discussion centered around the display may increase the students' understanding of scaling and its relationship to their visual world.

MENTAL ARITHMETIC

RATIONALE

Many of our day-to-day calculations are done mentally. Without using pencil and paper or a hand calculator, we often think about answers to such questions as: Did the clerk give me the right amount of change? How long will it take me to travel across town? How many boxes of candy will have to be sold for a fund-raising project needing \$500?

Mental arithmetic is an important basic skill which can be applied to many situations. One might perform mental checks on routine computations. Mental arithmetic can help students develop a better number sense and a better feeling about their ability to calculate answers. It may also improve their knowledge of basic facts and motivate them to move on to more advanced or applied mathematics. People can use mental arithmetic to improve the process of estimation and approximation by . . .

- 1) Checking for reasonableness and correctness of answers.
- 2) Getting "ball-park" estimates.
- 3) Rounding.
- 4) Computing with simplified numbers.
- 5) Multiplying and dividing by powers of ten.

The use of mental arithmetic can quicken the problem-solving process--especially for those problems which involve trial and error.

Just as any skill must be developed through practice, the ability to do arithmetic mentally can be improved with drill and mental calculations. These can be short and part of the daily routine (such as a five-minute warm-up activity). Or the activities can be longer and stressed early in the school year to develop the habit of using mental arithmetic. Encourage the students to do mental calculations whenever they are involved in checking pencil and paper calculations, calculator activities, and problem solving.

Selected Sources for Mental Arithmetic

Cutler, Ann and Rudolph McShane. The Trachtenberg Speed System of Basic Mathematics, Doubleday, 1960.

Garvin, Alfred E. Shortcuts, Checks and Approximations in Mathematics, J. Weston Walch, 1973.

Kramer, Klass. Mental Computation, Science Research Associates.

EXAMPLES OF MENTAL ARITHMETIC PAGES FOUND IN THE CLASSROOM MATERIALS

I. Games and Puzzles

Games and puzzles often require quick thinking. Figuring on paper or using a calculator is not always necessary or convenient.

SCALY

Materials: Game board
Marker for each player
Die

Rules:

- 1) Players each roll the die. Largest number goes first.
- 2) Scales:
 - a) 2 spaces for each dot on the die
 - b) 3 spaces for each dot on the die
 - c) 4 spaces for each dot on the die
- 3) Players roll the die, choose a scale to avoid the Go Back spaces, and move their markers forward. For example, if a player rolls a 5 on the die, and the 3:1 and 4:1 scales both would move him to a Go Back space, he would choose the 2:1 scale and move 10 spaces forward.
- 4) If all scales move a player beyond Scaly's eye, the player loses his turn.
- 5) The first player to exactly reach Scaly's eye is the winner.

This game involves chance and strategy. The player makes an educated guess between a scale of 2:1, 3:1, or 4:1 for each toss of the die. This requires a quick mental evaluation of the position on the playing board, the number on the die, and the best choices of a scale.

Equivalent ratios form patterns that can be assimilated mentally. This puzzle matches equivalent ratios and displays self-correcting answers.

THE WEATHER REPORT

What's The Weather Report In Mexico City?

TO FIND THE ANSWER, WRITE THE LETTER OF EACH RATIO ABOVE AN EQUIVALENT RATIO IN THE CHART BELOW. USE EACH RATIO ONLY ONCE. SOME RATIOS IN THE BOXES WILL NOT HAVE AN ANSWER.

C. 8:16	B. 44:4	M. 15:20	H. 14% 18	L. 3% 50	D. 5:25	T. 3:30	V. 1% 8	A. 8% 2

3% 4	15% 5	3% 4	15% 5

II. Concepts and Patterns

Once a basic concept is understood, one can use mental arithmetic and shortcuts to cut down computation. Patterns often lead to the answers and mentally following a pattern can reveal the final answer with minimal effort.

WE MUST WORK TOGETHER

We are both found in proportions.
Do you know the mathematical meaning of mean? The means are in the middle.

In politics the extremes are the far left and far right.

Complete the table.

	EXTREMES	MEANS	EXTREMES	MEANS
ADD THEM	9 and 4	12 and 3		22
SUBTRACT THEM				
MULTIPLY THEM				
DIVIDE THEM	2 1/2			

Did you discover a rule? Does it work for these proportions?

a) $\frac{3}{4} = \frac{6}{8}$ b) $\frac{12}{18} = \frac{6}{9}$
 c) $\frac{6}{10} = \frac{12}{20}$ d) $\frac{12}{15} = \frac{8}{10}$

Quick mental computation discloses the simple patterns and comparisons displayed in the charts.

Proportions can be solved by following a special pattern. In any proportion the product of the means equals the product of the extremes.

EATING CONTEST

Harry, Morgan, and Eddy had a hamburger eating and milkshake drinking contest.

1) Harry ate 2 hamburgers for every 1 hamburger Eddy ate.
a) Who ate more hamburgers? Harry or Eddy?
b) How many hamburgers did Harry eat during the contest?
c) Fill in this chart of possibilities.

NUMBER OF HAMBURGERS	HARRY ATE	EDDY ATE
2	4	10
3	4	7
4	10	26

2) Morgan drank 3 milkshakes for every 1 milkshake Harry drank.
a) Who drank the most milkshakes? Harry, Morgan or Eddy?
b) Fill in this chart of possibilities.

NUMBER OF MILKSHAKES	MORGAN DRANK	HARRY DRANK
3	9	18
4	12	11
5	8	

3) Harry ate 4 hamburgers for every 1 hamburger Morgan ate.
a) Fill in this chart of possibilities.
b) Who ate more hamburgers? Morgan or Eddy?

NUMBER OF HAMBURGERS	MORGAN ATE	HARRY ATE
1	3	5
4	8	16
5	7	24
6		36

4) Use the information in the problems above to fill in this chart of possibilities.

NUMBER OF HAMBURGERS	MORGAN ATE	HARRY ATE	EDDY ATE
1	2	5	
2		16	40
3		6	16
4			12

ESTIMATION and APPROXIMATION

RATIONALE

Why estimate and approximate? Why should we be concerned with educated guesses (estimation) or a process to improve the accuracy of an educated guess (approximation)?

Today, according to some authorities, 75% of adult non-occupational uses of arithmetic is mental. If we are concerned about students having a number sense, then we need to work on such things as: mental computation, rounded results, reasonableness of answers, a feel for large and small numbers, and numbers representing measures.

In our daily lives we use inexact numbers every time we measure. News sources frequently use approximations when discussing large numbers. Exact results are often not necessary, and they often obscure the issue. (Which would be better--49,717 people attended the football game, or "about 50,000," The family income is \$11,978 vs. The family income is \$12,000?)

For example, we make many educated guesses every time we

- a) plan a trip (How long will it take, when will we arrive, how much will it cost, what should we take?)
- b) determine a budget (I think we can go out for dinner and a show once this year.)

We make a life and death estimation when we decide if it is safe to cross the street, or if we can stop a car or

bike in time.

The reasonableness of calculated results can mean a difference of many dollars to each of us, whether it be in checking the change at the supermarket, figuring taxes, or making time payments on large purchases.

Often we need to locate the decimal point in computations by hand, with a slide rule, with a calculator, or in using square root tables. Even when we do long division problems we usually use some type of "guess and check" method.

We make "ball park" estimates for

- a) how many (hot dogs to order for a football game)
- b) how things compare (can 1,000 people fit into the ballroom?)
- c) personal information (if we could spend a dollar a second, how long would it take to spend a billion dollars?)
- d) functioning effectively in our daily lives.

Before anyone can make an estimation that is more than just a guess, he must first of all have a familiarity with certain reference points for measures of length, weight, time, area, volume, cost, and so on. Most of these come from experiences in the person's day to day world. They can be extended through development of measuring skills, arithmetic skills, and a number sense for large and small numbers. To obtain a "good" estimate, it is also useful to

have a knowledge of counting methods. (For additional information see Peas and Particles.)

Before a person can quickly check the reasonableness of an answer he must have already developed a wide variety of arithmetic skills. These must include:

- a) ability to perform accurately single-digit operations (9 million $\times$ 7 million requires $9 \times 7 = 63$)
- b) ability to multiply and divide by powers of ten
- c) ability to perform operations with multiples of powers of ten--mentally if possible
- d) being comfortable with inequalities and other relationships
- e) ability to round whole numbers and decimals to one or two significant digits.

It is also helpful for more difficult approximations if a person has a familiarity with exponential notation.

Here is an example which illustrates most of these points: About how long is a billion seconds?

$$\frac{1,000,000,000}{60 \times 60 \times 24 \times 365} = \text{years} \approx$$

$$\frac{1 \times 10^9}{60 \times 60 \times 20 \times 400} = \frac{1 \times 10^9}{3600 \times 8000}$$

$$\approx \frac{1 \times 10^9}{4 \times 10^3 \times 8 \times 10^3} = \frac{1 \times 10^9}{32 \times 10^6}$$

$$\approx \frac{1 \times 10^9}{3 \times 10^7} = \frac{1}{3} \times 10^2 \approx 33 \text{ years}$$

There is much to be said for knowing when to estimate and when to approximate, when to use an estimation or approximation, and when to use an exact answer. The use of estimation and approximation should help all persons to deal with exact numbers, understand and perform operations with numbers arising from measurement, deal comfortably with numbers through approximate calculations and rounding off, and in general develop a number sense. Finally, it would seem most worthwhile if teaching the techniques of estimation and approximation helped to eliminate the "exact answer" syndrome.

SUMMARY

These are the key points to be emphasized when teaching estimation and approximation:

1. When do we need to estimate and approximate to find a rough answer?
2. When do we need exact answers?
3. We often estimate "how many" (e.g., objects, people, items) or "how much" (e.g., money, air, water).
4. We often estimate the dimensions, capacity or amount of something we would measure. (Measurements are always approximate.)
5. Problem solving and computation is aided by the use of estimation and approximation to . . .
 - a) check the reasonableness of answers
 - b) narrow the scope of your investigations
 - c) simplify computations

6. The students need a sound background in arithmetic skills, number sense, and finding reference points.

EXAMPLES OF ESTIMATION AND APPROXIMATION IN THE CLASSROOM MATERIALS

I. Estimating "How Many"

Estimate the number of people that work at your school. How is the student-teacher ratio determined?

BEANS, BEANS

Materials: Two 1-gallon jars (same shape)
One jar is to be filled with beans and sealed
A dowel rod to calibrate a scale for the empty jar
A supply of extra beans
A team of 3 students

Activity:

- (1) Each student should make and record an individual guess of the number of beans in the jar.
- (2) Make a team guess. It may be the same as or different from the individual guesses. Discussing the guess should give a good approximation of the number of beans in the jar.
- (3) Place the dowel rod next to the jar and mark the rod to show the top of the jar.
- (4) Mark the rod into several equal parts. 10 or 20 marks would be convenient. Your scale is _____ lengths : 1 jar.
- (5) Place the rod in the empty jar and add beans to the first mark. Count the beans. What is your scale? 1 length : _____ beans. Repeat this three more times to get an average number of beans. Scale of 1 length : _____ beans.
- (6) Use the scale to predict the number of beans in the sealed jar.
- (7) How close to the prediction was each individual guess?
- (8) How accurate was your team guess?

The rounded bottom will affect results.

RATIOS IN YOUR SCHOOL

Fill in this chart. Guess first then get the actual numbers from your teacher.

PEOPLE IN YOUR SCHOOL	GUESSES		ACTUAL NUMBER
	Individual	TOTAL	
COUNSELORS			
SCHOOL NURSES			
YOUR CLASS			
ALL STUDENTS			
TEACHERS			
PRINCIPALS			
COOKS			
CUSTODIANS			
SECRETARIES			
TOTALS			

How many beans in the jar?

The container's volume plays an important part in finding a reasonable estimate for the number of beans.

II. Estimating "How Much"

How much money can you save on sales? Approximate your savings on various items that are discounted a given percent.

AT THAT PRICE, I'LL BUY IT

Donna wishes to buy a stereo. The Turntable Store has a 5000 set of stereo equipment that was marked 15% off. To find the amount of the discount Donna thought:

15% means \$15 for every \$100, so \$15 x 6 = \$90 off.

Sue looked at a stereo set costing \$279 that was marked down 20%. She thought, "20% means \$20 for every \$100, so the stereo is marked down about \$60 (\$20 x 3)." To know the actual discount Sue wrote 20% as .20 and multiplied .20 x \$279 to get a discount of \$55.80.

Use your percent sense to approximate the amount of these discounts. Then change the percent to a decimal and multiply to find the actual discount.

ITEM	COST	PERCENT DISCOUNT	APPROXIMATE DISCOUNT	ACTUAL DISCOUNT
STEREO	\$600	15%		
AM-FM RADIO	\$49	10%		
ELECTRIC GUITAR	\$189	20%		
10-SPEED BIKE	\$200	10%		
CALCULATOR	\$150	18%		
SKIING EQUIPMENT	\$300	30%		
T.V.	\$245	12%		
CAMPING EQUIPMENT	\$125	50%		
MOTORCYCLE	\$975	25%		

Draw the amount of area that represents the given percent.
A reference set is always necessary before an area can be compared and then drawn.

SEE-THROUGH DEMONSTRATION

Bring a number of see-through containers to class and display them on a table where all students can see them. (i.e., glass cylinders, test tubes, glass or plastic cubical containers, plastic pitchers (cylindrical), household measuring cups, drinking glasses, and some odd-shaped glass containers (i.e., vases, spherical glass bowls, cones, wine glasses).)

A number of concepts can be taught using these containers as visual aids and motivation.

I. Using a large pitcher, pour colored water (or rice or sand) into each container on the table to different levels.

Ask the students to identify the amount of water in each container (as compared to the volume of the whole container). For example, how full is the glass? Possible responses: 1/2 full, 50% full, .5 full, 50% empty. The most common response would be 1/2 full. Encourage students to give equivalent answers in percent and decimal forms.

II. Let the students take an active part in this demonstration by pouring water into the containers. For example, select a student(s) to fill each (or one) container approximately 1/4 full (or 25% full or .25 full).

Why are some containers easier to fill to the approximate amount than others? (Discuss visual illusions of odd-shaped containers.)

Estimate the amount of water it will take to fill each container $\frac{1}{2}$ or 50% full. How can you tell the real volume of each odd-shaped container? These experiments with volume test spatial relationships and the ability to estimate three-dimensional quantities.

LABORATORY APPROACHES

RATIONALE

What is the Laboratory Approach?

For many decades, learning, instead of just memorization and training, has been the primary emphasis of education. Each society or community decides what should be learned. We are required to learn mathematics, reading, science and other subjects. Yet our schools have been organized for teachers to teach and not necessarily for children to learn. The laboratory approach is a philosophy which emphasizes "learning by doing" and breaks free from formal teaching methods. "It is a system based on active learning and focuses on the learning process rather than on the teaching process." [Kidd, et al.] Experiences are devised to help the student learn mathematics by seeing, touching, hearing and feeling. An environment--the math lab--emerges where the teacher and the students work and communicate with each other to plan activities and learn by doing. At the level of their abilities and interests, the students discover relationships and study real-world problems which utilize specific mathematical skills.

A laboratory approach breaks the monotony of straight textbook teaching. It extends and reinforces the students' understandings and skills while providing background experiences for

later development of abstract concepts.

It also offers a unique, concrete way to learn mathematics. The laboratory approach can be integrated into the classroom and used along with, not in place of, many other equally valuable teaching strategies.

Lab activities help to eliminate the unrealistic one-method syndrome so characteristic of mathematics classes. A variety of methods of attacking a problem can be explored. Open-ended activities encourage students to make discoveries, formulate and test their own generalizations (i.e., problem solving). Lab assignments can be used to challenge the students by providing them with opportunities for developing self-confidence, habits of independent work, and enjoyment of mathematics. The relaxed atmosphere can encourage student involvement and positive attitudes toward mathematics. By direct observation, the teacher can assess the student's skills in problem solving and computing while the student's attitude and work habits can also be evaluated.

The Mathematics Laboratory

The math lab is an environment that provides for active learning and encourages active participation. In terms of physical organization, three basic kinds of mathematics laboratories are most often discussed.

1. A centralized laboratory--a room

especially designed (or adapted) and equipped for use as a permanent math lab. Classes are usually brought into the lab room on a rotating schedule that allows each mathematics class to use the lab materials several times a week as needed.

2. A rolling or movable laboratory--a set of lab materials placed on a cart, stored in a central location, and wheeled from classroom to classroom as needed.
3. A decentralized laboratory--a self-contained set of lab materials stored in the teacher's classroom and readily available for the students to use.

For most schools, the decentralized laboratory is the most practical and desirable math lab. Lab materials can be collected and organized at a modest rate as they are constructed, donated or purchased.

Eventually a set of lab materials will grow to a size large enough to be quite versatile. The classroom environment needs to be versatile as well. Flat tables, bookcases, movable carts and other furniture can be added to provide work areas for the students and storage space for the lab activities.

What is a Laboratory Activity?

A laboratory activity is a task or mathematical exercise that emphasizes "learning by doing." It can be a game, a puzzle, a paper and pencil exercise, a set of manipulatives with a task card, or an experiment using apparatus and instruments to take measurements. A

game involving two or more students might review the concept of equivalent fractions. A challenging puzzle could require a student to apply several problem-solving techniques. A lab activity could use Cuisenaire Rods to illustrate decimal concepts, or multi-base blocks to show place value, or wooden cubes to demonstrate spatial relationships, or factor boards to clarify an algorithm. Manipulative objects often provide physical models that can introduce or clarify a mathematical concept to the student. There are also experiments which can be performed to take measurements and gather data. Students learn how to use certain equipment and tools in their search for solutions. Laboratory activities can directly involve students in "hands-on" assignments, often with group participation. Lab activities encourage the student to take an active role in learning mathematics rather than the passive role of "you teach me."

Getting Started

There are many ways to implement the lab approach. The descriptions below provide several suggestions to consider when starting to use the laboratory approach.

Mr. Langford has a class of thirty seventh graders. He was not sure about using lab materials, so he decided to start small. He set up an "activity

corner" in the room. Three lab cards with the necessary equipment (e.g., squared paper, ceramic tile, measuring tape, metric wheel) were set up in the "activity corner." Each day for a week a different group of six students were allowed to work in pairs using the lab materials. The rest of the class worked on related paper and pencil exercises. All week was spent on the study of area. All thirty students had a chance to do the lab activities, and the activities integrated well with the week's mathematics concept of area. Mr. Langford wants to collect or write task cards that mix well with his established curriculum. Later, he might try other ways of using the lab activity cards.

Ms. Wilkins decided to assign each Friday as a "lab day" for her eighth-grade class of 28 students. She had watched several classes using a "lab day" once a week and decided to try it herself. She prepared two sets of seven lab cards covering seven different mathematic topics. Each student was assigned a partner, and the pair would work together for each of the seven "lab days." For seven weeks the students rotated to a new lab activity each Friday. They were asked to keep a record of their results and follow the planned rotation schedule. Ms. Wilkins found that this seven-week period with

one "lab day" a week coincided well with the nine-week term. She developed a second set of lab materials for another seven weeks. This time there were 14 task cards put into 14 shoe boxes along with manipulatives, paper, or other materials needed for each activity. Each card was written on the topic of measurement and contained various levels of abstraction and enrichment options for the students.

Mr. Jeffreys and Ms. Slone had adjoining sixth-grade rooms. They had been team teaching a number of units in mathematics. They decided to try the lab approach for their unit on Base 10 and Other Bases. Their school had recently purchased two Chip Trading Math Lab Sets. Mr. Jeffreys and Ms. Slone picked out several chip trading activities to be used every other day for two weeks. They divided the class into groups of 3 or 4 students. For each "chip trading day" one student in each group was responsible for picking up and distributing the manipulatives to each member of the group. The days between each "chip trading day" were used for discussions, board work, and worksheets that emphasized paper and pencil computation in base 10 and other bases.

The above are examples of teachers who were willing to support an active approach to learning. They prepared for using the lab approach by collecting and organizing

materials and deciding on the content of lab activities. It helps to gain the support of other teachers; their contributions and ideas can rapidly increase the number of lab activities developed.

Most difficulties that arise in the math lab result from students not knowing what to do. The teacher needs to find, organize and store lab materials for easy use; tell students where lab materials are, what to do with them and how to schedule their use; prepare task cards or directions for the lab activities; instruct students in problem-solving methods of attack and investigation; interact enthusiastically with students and share in their experiences; and evaluate each student's attitudes, work habits and accomplishments.

Start small--in no way can most teachers and students survive a complete change of program. Students who have become passive learners need time to adapt to the role of active learners. They need supervision and guidance from the teacher as they learn to function in the lab environment. Eventually, the students should be able to select materials for each lab activity and return materials to the proper storage area when finished. By keeping a work record, the students can evaluate their progress and try to improve their skills

and understanding. The students need to develop inquisitive attitudes that motivate them to keep at a problem and not give up. Small groups or pairs of students will require the cooperation of each individual and the sharing of ideas.

Initially, when selecting material and equipment to use in the math lab, find readily available materials in the school. As time goes on, you will be able to buy, make or scrounge other materials as they are needed for particular activities.

Ideas for laboratory activities can be found in any of the sources listed in the selected sources. Many periodicals (such as The Arithmetic Teacher or The Mathematics Teacher) include sections in each issue which contain ideas for activities that require a minimum of preparation and materials. Notice the interests of the students. Be creative and use your own ideas or their ideas as a source of lab activities. Discuss and exchange ideas about math labs with other teachers.

Begin with a lab activity that everyone can do at the same time. Later on, the students can separate into groups or small teams (students usually work best in small groups of 2 or 3). Experiment with the size and the make-up of the groups. In the beginning it is a good idea to provide activities where each group member has a specific role. Provide several lab activities and let each

group move from one activity to another. Have specific objective(s) in mind for each activity, and have a clear idea of its mathematical content. Go through the lab activity to find what background concepts or skills the students will need to tackle it. Check for any difficulties the students might encounter as they do the activity.

SUMMARY

1. The laboratory approach is a system that emphasizes learning by doing; it involves the student in multi-sensory experiences that often require social interaction as well as physical participation and problem-solving skills.
2. There are several types of math labs--even math lab is versatile; each includes lab materials; each requires careful organization and upkeep.
3. A laboratory activity is a task or mathematical exercise that provides an active role in learning for the student.
4. One can implement the lab approach in various ways:
 - a) Set up an activity corner and allow a few students each day to work on assigned lab activities.
 - b) Declare a lab day; perhaps once a week the whole class will be involved in lab activities.
 - c) Pick out a particular topic or unit in mathematics; develop a number of lab activities for the specific topic and have the students work through the various activities each day or every other day.
 - d) Be brave; try the laboratory approach and plan your own creative schedule and activities for the students.
5. Most difficulties that arise in the math lab result from students not knowing what to do.
6. Start small--there are many materials and ideas to use in a math lab. Do not be overwhelmed, but collect lab materials gradually, adding manipulatives, games, task cards, etc. as you have time to make and/or develop them.

EXAMPLES OF LABORATORY ACTIVITIES FOUND IN THE CLASSROOM MATERIALS

I. "Homemade" Materials

When selecting materials and equipment to use for lab activities, it is relatively inexpensive and simple to use available materials in the school. Apparatus or equipment can often be made by the students. Active participation in measurement activities helps to build concepts through visual, concrete experiences.

**A QUESTION OF
BALANCE**

Materials needed: 9 spring-loaded paper clamps
Metric Stick
Long Nail
Masking Tape

Procedure: Make a balance as follows: Slip a clamp over the nail and tape the nail to the table. Put the metric stick in the clamp. If the stick tilts, move it left or right in the clamp until the stick is level. The center of the clamp marks the center of the stick.

a) Put a clamp on the right side of the stick so that the center of the clamp is 10 centimeters from the center of the stick. Hang a second clamp from the first. Place one clamp on the left side to level the stick. How far from the center is this clamp?

b) Place the 2 clamps to the right 15 cm from the center. Where do you have to place the clamp on the left to level the stick?

c) Place the 2 clamps 20 cm from the center. Estimate where you should place the clamp to the left to level the stick. Try it. Start to fill in the table. Watch for a pattern.

d) Place the 2 clamps to the right 10 cm from the center. Hang a third clamp on them. Level the stick with one clamp. Where is it? Is it where you expected?

e) Try leveling the stick in other ways. Use 1 clamp on one side and 3 on the other. Then use 3 on one side and 4 on the other.

RIGHT		LEFT	
Number of Clamps	Distance from Center	Number of Clamps	Distance from Center
2	10 cm	1	
2	15 cm	1	

A measuring instrument (in this case, an alidade) is often used to record mathematical data and to analyze our environment.

A simple apparatus can provide students with an experiment that uses problem-solving skills such as filling a chart and looking for patterns.

**STAKE
YOUR CLAIM**

There are a number of ways to make a scale drawing of a field. Some methods use expensive pieces of equipment to do this accurately, but it is possible to make a good scale drawing using equipment from the classroom.

Equipment: Flat table or board placed on top of an inverted wastebasket
Ruler
Tape
*Alidade
Large sheet of drawing paper

*An alidade is a straightedge with sights and can be made with a ruler and two nails.

1. The students should familiarize themselves with the region before beginning the scale drawing. Landmarks, especially those that indicate the shape of the region, should be located. The landmarks could be listed or a rough sketch of the region drawn with each landmark labeled. Markers are needed at the corners of the field if natural landmarks do not occur.

4. Place point P over stake F. Use the alidade to line up point Q on the paper with stake Q (you may have to turn the table slightly). The table must remain in this position as you sight each landmark from point P.

ALL ABOUT YOU

Materials Needed: 1 or 2 students; metric stick; string or metric tape measure.

For each student measure and record these lengths to the nearest centimetre.

NAME →				AVERAGE
Height (no shoes)				
ARM SPAN				
HAND SPAN				
PALM SPAN				
LITTLE FINGER				
MIDDLE FINGER				
HEAD				
FOOT				

Use your chart to find the ratios of these lengths.

NAME →				AVERAGE
ARM SPAN to height				
FOOT to height				
LITTLE FINGER to middle finger				
MIDDLE FINGER to ring finger				
PALM SPAN to hand span				
HEAD to foot				

in the numbers in the average column to find these ratios.

add the three numbers and divide by 3.

The students develop an awareness of their body and how it can be described and compared using mathematics.

II. The Cube as a Lab Manipulative

Cubes are versatile, "hands-on" objects. They can be used to bridge the gap between abstract thinking, scale models and physical reality.

The students look at the abstract two-dimensional drawings of a solid and then construct the corresponding three-dimensional figures using cubes.

HOW WELL DO YOU STACK UP THIS TIME?

Materials needed: A set of cubes.

Activity: Use the three views. First, estimate the number of cubes needed and then build the model.

Example:

	Top	Front	Side		Top	Front	Side
1				6			
2				7			
3				8			
4				9			
5				10 Challenge			

Students build physical models to clarify the problem and help them understand the concepts of volume and ratio.

THE PERCENT PAINTER

Get 100 cubes to make each of these models or answer the questions by looking at the diagrams.
Suppose the percent painter was able to paint the entire surface, including the bottom, of the model. Fill in the table for each of the models that you make. Make a model.

What percent of the volume would have: _____ of your own.

Model	A	B	C	D	E
6 faces painted					
5 faces painted					
4 faces painted					
3 faces painted					
2 faces painted					
1 face painted					
0 faces painted					

MODEL A
100 CUBES LONG
10 CUBES HIGH
10 CUBES WIDE

MODEL B
25 CUBES LONG
5 CUBES HIGH
5 CUBES WIDE

MODEL C
10 CUBES LONG
10 CUBES HIGH
10 CUBES WIDE

MODEL D
10 CUBES LONG
5 CUBES HIGH
5 CUBES WIDE

MODEL E
5 CUBES LONG
5 CUBES HIGH
5 CUBES WIDE

THE PERCENT PAINTER

Volume and Ratio 2

Materials needed: A set of centimetre cubes

Activity:

(1) a) Use the cubes and make this model.
b) The volume (in cm^3) of this model is _____.

(2) Make 3 models:

a) One twice as long as Model 1.
b) One twice as long and twice as wide as Model 1.
c) One twice as long, twice as wide, and twice as high as Model 1.

MODEL 1

Model	Dimensions	Volume (cm^3)	Ratio of the volumes of this model to Model 1	Simplified ratio
a	$6 \times 2 \times 1$	12 cm^3	: 6	: 1
b			:	:
c			:	:

(3) Make 3 more models:

d) One three times as long as Model 1.
e) One three times as long and three times as wide as Model 1.
f) One three times as long, three times as wide, and three times as high as Model 1.

Model	Dimensions	Volume (cm^3)	Ratio of the volumes of this model to Model 1	Simplified ratio
d	$9 \times 2 \times 1$	18 cm^3	: 6	: 1
e			:	:
f			:	:

(4) Compare the simplified ratios with the simplified ratios in Volume and Ratio 1.
(5) If the simplified ratio of the volumes of a model to Model 1 is 16:1, how many of the dimensions are four times larger than Model 1?

To fill in the table, the students can make each model or look at the diagrams, depending on their ability to abstract the situation.

III. Grid Activities

Grids and grid paper are used as two-dimensional models that pictorially represent many concepts in ratio, percent and scaling. Construction activities that involve making models, scale drawings or geometric figures often utilize grid, isometric paper or squared paper.

This activity features several puzzles, such as fitting together all the pentominoes to cover a given area, and a game with pentominoes. Puzzles and games entertain yet provide important practice with shapes and ideas.

LAKE & ISLAND BOARD

This is a scale drawing of a "Lake and Island" board. To construct the board, cut a 30 cm square from colored railroad board. Enlarge the pattern 1 to 1. Clip the enlargement to the board and perforate the corners of each island with a compass point. Cut the islands from poster paper of contrasting color and use the compass marks to help glue the islands to the board. For durability laminate.

Students can determine the area of each island by using centimetre cubes or a transparent centimetre grid.

1. Use Island C as the reference set. What percent of C is each of the following? Estimate first.

Island A	Island D	Island I
Island B	Island E	Island J
Island C	Island F	Island K
Island G	Island H	

Change the reference set. If Island J is the reference set, what percent of J is Island A? B? D? E? I? K?

2. Use the entire board as the reference set.

(a) What percent of the board is water, islands?

(b) If a woman parachutes from a plane over the area what are her chances of landing on Island A?

The ability to measure angles and line segments, to make scale drawings, and to construct models is examined in this lab activity.

THE PERPLEXING PENTOMINOES

Materials needed: Five squares, 3 centimetres on a side, and centimetre grid paper or five 1-inch tiles and inch grid paper.

Activity:

- 1) A pentomino is a pattern made by joining 5 squares together so that each shares a common side with another. How many different pentominoes do you think there are?
- 2) Take the 5 squares and make all the pentominoes that you can. Copy each pentomino pattern on the grid paper and cut out the shape. If one of the patterns can be turned or flipped to exactly fit another one, the two patterns are the same pentomino.
- 3) Check with your teacher to see if you have found all the pentominoes.
- 4) Try to arrange the pentominoes so that they make the rectangle. Do not overlap the pieces. There are more than 2000 ways to do this!

EXAMPLES

These four patterns are the same pentomino.

5) Play a game using the pentominoes.

Needed: 2 players

Game mat is an 8 by 8 square constructed out of the grid paper with alternate squares shaded.

- a) Players alternate picking pentomino pieces until all the pieces have been selected.
- b) Each player in turn then places a pentomino on the mat. Play continues until it is impossible for a player to place on that mat a pentomino that doesn't overlap another pentomino or lie completely on the mat.
- c) The winner is the last person to successfully place a pentomino on the mat.

The Lake and Island Board can be constructed for use with a number of lab activity cards. Here the students use the board to do percent exercises.

PLATO AND THE SOLIDS -- AN OLD GROUP

Use colored construction paper to make a larger scale model of these patterns. Cut along the solid lines and fold along the dotted lines. Tape or paste along the tabs. Rubber cement works well.

CLASSROOM MATERIALS

RATIO

Ratio is one of the most useful ideas in everyday mathematics. Here are a few examples of the use of ratio in newspapers and magazines.

TEL AVIV AP

Israel has the highest ratio of physicians. There is one physician to every 420 people.

In the last year of the Civil War the North had 4 soldiers for every soldier from the South.

In 1973 1 out of every 25 homes in Eugene, Oregon was burglarized.

SPORTS

LONDON AP

Jack Nicklaus is a 1-4 favorite to capture the British Open which starts Wednesday at Carnoustie, Scotland.

DURHAM, NEW HAMPSHIRE
VOTED 14 to 1 AGAINST
PROPOSED OIL REFINERY

A ratio is an ordered pair of measures. The ratio of Northern soldiers to Southern soldiers in the last year of the Civil War was 4 to 1. This tells us that for every 4 soldiers from the North there was only 1 soldier from the South. From this ratio we know the relative size of the two sets, but we are not given the numbers of soldiers. This is the essence of the idea of ratio; it gives relative measures which can be used for comparisons.

INTRODUCING YOUR CLASS TO RATIOS

Each of the pictures from the student page *Ratios by Picture II* in the section RATIO: Equivalent illustrates a ratio. For each ratio there is a corresponding list of pairs of numbers which are in the given ratio.

(A)

Flashlights to Batteries

1 for every 2

2 for every 4

3 for every 6

4 for every 8

.

.

.

(B)

Shoes to Horses

4 for every 1

8 for every 2

12 for every 3

16 for every 4

.

.

.

(C)

Tires to Cars

5 for every 1

10 for every 2

15 for every 3

20 for every 4

.

.

.

With these lists of pairs of numbers the student can answer such questions as: If there were 6 cars, how many tires would there be? If there are 12 flashlights, how many batteries would there be?

Guessing Game

This game can help your students develop the idea of ratio. Place two kinds of objects in a box, for example, pencils and chalk, and tell your class the ratio. Suppose the ratio of pencils to chalk is 2 to 3. You may wish to explain this means there are 2 pencils for every 3 pieces of chalk. Now the class, or possibly teams from the class, try to guess the number of pencils and chalk. For example, 8 pencils and 12 pieces of chalk would be one possibility. Ten pieces of chalk would not be possible. What are the possibilities for the total number of pencils and pieces of chalk?

<u>Pencils</u>	<u>Chalk</u>	<u>Total</u>
2	3	5
4	6	10
6	9	15
8	12	20
.	.	.
.	.	.
.	.	.

SIMPLIFYING RATIOS

Ratios involving whole numbers are usually stated with the smallest possible whole numbers. In the example of the Durham, New Hampshire voters there were 14 against the refinery to every 1 for the refinery. The ratio is also 1190 to 85, since for every 1190 votes against the refinery there were 85 votes for the refinery. However, the smaller numbers, 14 to 1, are preferred. Conveying the relative size of large sets by small numbers is one of the advantages of the idea of ratio.

In the tables of ratios shown on the previous page, each pair of numbers is a multiple of the first pair. Therefore, dividing any pair of numbers in a table by a common factor will produce a smaller pair of numbers which are also in the table. When the two whole numbers in a ratio have no common factors other than 1, the ratio is said to be a simplified ratio.

Number Against to Number For

1190 85

Divide
by 5

238 17

Divide
by 17

14 1

- Simplified Ratio

Activities for Simplifying Ratios

Play the Guessing Game described above by placing a number of pieces of chalk and pencils in a box. This time tell the students the number of each kind and ask them for the simplified ratio. Suppose, for example, there are 18 pencils and 30 pieces of chalk. When a ratio is given, have them check by listing its equivalent ratios.

Pencils to Chalk

3 . . . 5

Guess Simplified
Ratio

6 . . . 10

9 . . . 15

12 . . . 20

15 . . . 25

18 . . . 30

Multiply numbers in
the simplified
ratio by 6.

There are some tables in the student text where the students complete the data and compute the corresponding ratios. Here are some examples.

	number	ratio	simplified ratio
Students that are left-handed			
Students that are right-handed			

	number	ratio	simplified ratio
Students that ride a bike to school			
Students that do not ride a bike to school			

RATES ARE RATIOS

A rate is a special kind of a ratio in which the two sets being compared have different units of measure. Some texts call such a ratio a rate pair.

The two units in this cartoon are dollars and cords. The rate, \$95 per cord, is a ratio between number of dollars and number of cords and gives rise to the pairs of numbers shown in this table.

Dollars to Cords

95	1
190	2
285	3
.	.
.	.
.	.

Suggested Activities

Start a bulletin board of rates.

Have each student bring in an example of a particular rate. Rates, such as miles per hour, cost per hour, births per day, accidents per month, gallons per mile, etc., will be easy to find in newspapers and magazines.

"You ask me what I see in the dancing flames?
I see logs that cost ninety-five dollars a cord, that's what."

	Gallons	Miles
	1	22
	2	44
	3	66
	4	88

The Guinness Book of World Records and almanacs are valuable sources of rates. Your students might be interested in finding out which countries have: the highest birth rate; the greatest income per person; the lowest infant mortality rate; the greatest density of people per square mile; and the highest death rate. There are speed records for people, animals, birds, planes and cars where the rates usually involve a unit of length and a unit of time.

Your students can use each of these rates to generate pairs of numbers, like those shown at the right for the world's speed typing record.

The world population in mid-1972 was estimated to be 3.7 billion, giving a population density of 72.7 people per square mile.

Speed Typing Record

<u>Number of Minutes</u>	<u>Number of Words</u>
1	170
2	340
3	510
⋮	⋮

USING REAL NUMBERS TO REPRESENT RATIOS

Sometimes the first number of a ratio is divided by the second number, and the resulting quotient is used to represent the ratio. For example, Federal law says that the ratio of the length to width of the official United States flag must be 1.9. This means that no matter what the size of the flag, the length divided by the width should be 1.9. The largest flag in the world is the Stars and Stripes displayed annually on the side of J. L.

Hudson's store in Detroit, Michigan. Its length is 235 feet and its width is 104 feet. Does the number 1.9 represent the ratio of the length to the width of this flag?

Students often have difficulty solving ratio problems when a single real number is used to represent a ratio. The same difficulty often occurs with rates. To eliminate this problem the classroom materials of this resource use the ratio notation (1.9:1) whenever practical.

Suggested Student Activities

1. Measure the length and width of your school flag. Divide the length by the width and compare this number with the official ratio represented by 1.9.

2. Draw several different squares and compute the real number which represents the ratio of the length of a diagonal to the length of a side. Compute this number to one decimal place. Will this number always be the same? See the student page *A Special Ratio in all Squares* in the section RATIO: Ratio as a Real Number.

3. Draw several circles of different sizes and find the ratio of the circumference to the diameter. Computing the related real number to one decimal place, will this number always be the same? See student pages: *Pi's the Limit*, *A Very Special Ratio* and *Buffon's Pi* in the section RATIO: Ratio as a Real Number.

Terminology

The word "ratio" has never been a favorite outside the mathematics classroom. In newspapers, books and magazines the word "ratio" and notations for ratios are usually avoided by such expressions as: 4 to 3; 2 out of 5; 9 for every 1; etc.

Ratio is a Latin word for the verb *rerī* (past participle, *ratus*) which means to think or estimate. In the Middle Ages it was commonly used to mean computation. To express the idea of ratio as we use it today, the medieval Latin writers used the word "proportio," and most mathematical works of the Renaissance times used the word "proportion." This language has by no means died out as can be seen in such expressions as: "Mix the sand and water in the proportion of 3 to 1;" or "Divide this in the proportion of 2 to 3." The use of the word proportion for ratio was never universal, and over the years ratio has become the accepted term in mathematics.

Notation

It is pedagogically sound to introduce students to a concept before bringing in notation. The examples and activities up to this point have not required the use of ratio notation, and yet the basic idea of ratio has been introduced and used. When a notation for ratios is used, two of the most common are

$$a:b \quad \text{and} \quad \frac{a}{b}$$

Both of these are read as: "the ratio of a to b." These notations can be avoided in the introductory stages of using ratios and perhaps should be avoided by merely writing out the expression "a to b." The fraction notation $\frac{a}{b}$ is especially confusing to students when it is used as a ratio to compare two disjoint sets. This will be examined further in the next section.

RELATIONSHIP OF RATIOS TO FRACTIONS

In some cases, the same situation may be described by either a fraction or a ratio. Although not all authors agree, this resource uses the terms "ratio" and "fraction" in the following way.

Ratio: A ratio is an ordered pair of measures. Any two positive real numbers may be used in a ratio. These numbers may be whole numbers, fractions, or irrational numbers. For example, in any 30-60-90 right triangle the ratio of the length of the hypotenuse to the length of the longest side is always 2 to $\sqrt{3}$.

Fraction: A fraction is a number represented by an ordered pair of integers, written $\frac{a}{b}$ for $b \neq 0$. Fractions are often used to describe part of a whole as shown by the diagram at the right.

Fractions are also used to compare part of a set to the whole set. In the example shown here $\frac{3}{12}$ or $\frac{1}{4}$ of the balls are white. The fraction $\frac{1}{4}$ compares part of the set (a subset) to the whole set. A ratio is often, though not always, used to compare two disjoint sets. For example, the ratio of white balls to black balls is 3 to 9 (1 to 3 or $\frac{1}{3}$).

$\frac{7}{10}$ of the rectangle is not shaded.

In this example both the fraction and the ratio tell the relative sizes of the two sets, but neither gives the actual size. The fraction $\frac{1}{4}$ compares a subset with a set, and the ratio 1 to 3 compares two disjoint sets. This example shows how the use of fractions to represent a ratio can be confusing. The ratio of white balls to black balls is $\frac{1}{3}$, and yet only $\frac{1}{4}$ of the balls are white.

Sometimes a ratio is used to compare a subset to a set. Using the 12 balls above, the ratio of white balls to the total number of balls is 1 to 4 or $\frac{1}{4}$. In this case, the idea of ratio is being used like a fraction, that is, part of a set is being compared to the whole set.

Here are four examples of the use of ratio. The first two of these examples compare disjoint sets; the third compares a subset and set. How would you interpret the fourth example?

- a) Durham, New Hampshire voted 14 to 1 against a proposed oil refinery.
- b) In the last year of the Civil War the North had 4 soldiers to every soldier from the South.
- c) In 1973 1 out of every 25 homes in Eugene, Oregon was burglarized.
- d) Israel has the highest ratio of physicians. There is 1 physician to every 420 people.

Ratio statements can often be replaced by fraction statements. To do this it is necessary to look at the sets being compared. Suppose, for example, that the ratio of hospital patients with type O blood to those without type O blood is 3 to 2. In this case, two disjoint sets are being compared. We can use fractions and say that $\frac{3}{5}$ of the patients have type O blood or that $\frac{2}{5}$ do not have type O blood.

Sometimes we wish to convert ratio statements given by odds into fraction statements. Suppose the odds on Blue Boy winning were 1 to 3. This means that for every dollar that is bet on Blue Boy the odds makers will put up 3 dollars. In terms of fractions Blue Boy has $\frac{1}{4}$ (not $\frac{1}{3}$) of a chance of winning.

Ratio is one of the most fundamental and important ideas

in mathematics; yet it is not given much attention in many elementary or secondary classrooms. We could increase students' abilities to understand many word problems and applications involving rates and ratios if we would provide them with a better intuitive idea of ratio. Using tables and the "for every" phrase seems to make ratio much more understandable. Writing a rate such as 30 g/cc as 30 grams for every 1 cubic centimetre or 30 g for every 1 cc can help students start a table. Answers to rate problems can be seen as logical when they occur in such a table. Let's give students a chance to use their intuition and logic on ratio problems before they learn to solve them formally.

"I'd like to place
a 25-dollar
bet on Blue Boy"

"That means we
pay you \$75
if he wins."

COMPARISON 1

TEACHER DIRECTED ACTIVITY

Making Number Comparisons
Getting Started
RATIO

It is often useful to compare numbers or measurements. These are some phrases that are used for making comparisons.

- | | |
|---------------------------------------|----------------------|
| \$40 more than | 2 sizes smaller than |
| \$5 less than | 6 inches larger than |
| 10 inches shorter than | 2 floors higher than |
| 3 centimetres taller than | 4 metres lower than |
| 20 pounds fatter than | 23 years older than |
| $1\frac{1}{2}$ kilograms heavier than | 8 times as long as |

Example #1:

Write the numbers 2000 and 20 on the chalkboard. How can we compare these two numbers?

- I) $2000 > 20$ (greater than)
- II) 2000 is 1980 more than 20 (difference)
- III) 2000 has two more digits (zeros) than 20
- IV) 2000 is 100 times as much as 20 (times)
- V) Be receptive to other student responses.

Example #2:

Write the measurements "100 cm" and "3 metres" on the chalkboard. How can these measurements be compared?

- I) 3 metres $>$ 100 centimetres (Note that $100 > 3$, but we are not comparing the numbers.)
- II) 3 metres is 200 centimetres longer than 100 centimetres.
- III) 3 metres is a shorter way of writing 300 centimetres.
- IV) 3 metres is 3 times as long as 100 centimetres.
- V) Any other student answers?

The following student page has statements in which numbers or measurements can be compared. Ask students to make several comparisons, especially the "times" comparison (i.e., times more than, times longer than).

Note the first statement: Does this mean the dinosaur egg was 6 times bigger or 6 times longer? (How would the volumes compare?)

TYPE: Chalkboard/Activity

See Comparison 2 for a student worksheet.

COMPARISON 2

Making Author Comparisons
Getting Started
RATIO

Make several comparisons using the numbers or measurements in each statement below.

1. A chicken egg is about 5 centimetres long. The largest dinosaur egg was about 18 centimetres long.
2. Several years ago the cost of sugar was 18¢ per kilogram. Recently, sugar has cost \$1.40 per kilogram.

3. A Volkswagen will get around 12 kilometres per litre of gas, while a Cadillac gets about 3 kilometres per litre.

4. The population of River City was 300 people in 1950. By 1970 the population was 900.

5. A garden snake is about 50 centimetres long. The largest prehistoric snake was about 14 metres long.

6. A common earthworm is about 10 centimetres long. The longest species of earthworm is about 2 metres long.

7. A calculator can do 100 calculations in one minute. A computer can do 600,000 calculations in one minute.

8. A family that grows their own mushrooms says they raise about 26 kilograms of mushrooms a year. The largest mushroom farm in the world produces about 15,000,000 kilograms of mushrooms a year.

9. Hailstones are often about $\frac{1}{2}$ centimetre across. The largest recorded hailstone was about 19 centimetres across.

10. Often cars travel at 90 kilometres per hour. The BLUE FLAME is a rocket engine car that was clocked at 1050 kilometres per hour.

TYPE: Paper & Pencil/Discreet

PATTERNS FOR INTRODUCING RATIO

Using Patterns
Getting Started
RATIO

TEACHER IDEAS

There are many patterns all around us. Some are difficult to see or understand. Other patterns seem obvious and are taken for granted.

Show the students various patterns. By making some easier, some harder, you can set the pace, reinforce responses and challenge the class. Have students continue the patterns.

- a) 1, 2, 3, . . .
- b) 1, 2, 4, 8, . . .
- c) $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, . . .$
- d) 1, 4, 9, 16, . . .
- e) 1, 1, 2, 3, 5, 8, . . .

Continue the patterns by writing the next two pairs of numbers.

a) (1, 2)	b) (1, 2)	c) (1, 1)	d) (0, 5)	e) ($\frac{1}{2}, 2$)
(2, 3)	(2, 4)	(2, 4)	(1, 4)	($\frac{1}{3}, 3$)
(3, 4)	(3, 6)	(3, 9)	(2, 3)	($\frac{1}{4}, 4$)
(4, 5)	(4, 8)	(4, 16)	(3, 2)	($\frac{1}{5}, 5$)
_____	_____	_____	_____	_____
_____	_____	_____	_____	_____

Each set of number pairs is related by a constant (same) sum, difference, product, or quotient. Discuss these relationships carefully with the students.

Students should identify the pattern and write three more number pairs in each problem.

a) (10, 5)	b) (3, 4)	c) (70, 10)	d) (2, 5)
(8, 3)	($\frac{1}{2}, 24$)	(28, 4)	($\frac{1}{4}, 6\frac{3}{4}$)
(16, 11)	(12, 1)	(21, 3)	(4, 3)
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____

TYPE: Chalkboard/Discussion

A student worksheet, *Constant*
Comments, uses these ideas.

Constant Comments

Using Patterns
Getting Started
RATIO

Look at the following sets of number pairs. The pairs in each set are related by a constant (same) sum (+), constant difference (-), constant product (x), or constant quotient ($\div$). How are the pairs related? Write three more number pairs which fit the pattern.

Example: The pattern is:

(10, 2) $10 \div 2 = 5$

(50, 10) $50 \div 10 = 5$

(25, 5) $25 \div 5 = 5$

(40, 8)

(100, 20)

(37, 7)

5 is the constant quotient

1 (6, 6) (36, 1) (2, 18) _____ _____ _____	2 (12, 0) (2, 10) (8, 4) _____ _____ _____	3 (18, 9) (14, 7) (6, 3) _____ _____ _____
4 (2, 2) (7, 7) ($\frac{1}{4}$, $\frac{1}{4}$) _____ _____ _____	5 (6, 4) (12, 2) ($\frac{1}{2}$, 48) _____ _____ _____	6 (8, 2) ($\frac{1}{2}$, $\frac{9}{2}$) (5, 5) _____ _____ _____

BODY COMPARISONS

Comparing with Lengths
Getting Started
RATIO

E
S
I

EQUIPMENT: STRIPS OF PAPER, SCISSORS

1. WORK WITH A PARTNER. FROM A STRIP OF PAPER (ADDING MACHINE TAPE OR NEWS-PAPER) CUT A PIECE THE WIDTH OF YOUR PARTNER'S PALM.

2. CUT A STRIP THE LENGTH OF YOUR PARTNER'S CUBIT.
3. HAVE YOUR PARTNER MEASURE YOU IN THE SAME WAY.

4. ESTIMATE THE NUMBER OF YOUR PALMS IN YOUR CUBIT. CHECK YOUR ESTIMATE USING YOUR PAPER STRIPS. COMPARE YOUR RESULTS WITH YOUR PARTNER.

5. IN THE SAME WAY ESTIMATE THE NUMBER OF SPANS IN A CUBIT. HOW MANY TIMES LONGER IS YOUR CUBIT THAN YOUR SPAN?

6. ESTIMATE FIRST, THEN WORK OUT OTHER BODY COMPARISONS.
 - A) WIDTH OF YOUR FOOT TO THE LENGTH OF YOUR FOOT.
 - B) CIRCUMFERENCE OF YOUR HEAD TO THE CIRCUMFERENCE OF YOUR WRIST.
7. MAKE UP SEVERAL OF YOUR OWN BODY COMPARISONS.

The comparing of the strips of paper can be done by the "eyeballing" method or by moving the smaller strip along the longer strip.

TYPE: Activity

RATIOS BY PICTURE I

Determining Ratios
Getting Started
RATIO

WRITE THE RATIO THAT IS SUGGESTED BY EACH OF THESE PICTURES.

___ FLASHLIGHT FOR EVERY ___ BATTERIES OR 1:2

___ HORSESHOES FOR EVERY ___ HORSE OR ___:___

___ TIRES FOR EVERY ___ CAR OR ___:___

___ EGG CARTON FOR EVERY ___ EGGS OR ___:___

___ CHECKERS FOR EVERY ___ SQUARES ON A CHECKERBOARD OR ___:___

DRAW A DIAGRAM AND WRITE A RATIO FOR EACH OF THESE STATEMENTS.

- F) 1 SINGLE DIP ICE CREAM CONE FOR EVERY 15¢
- G) 6 CANDY BARS FOR 79¢
- H) 3 TENNIS BALLS FOR 1 CAN
- I) 25¢ FOR EVERY 3 PACKS OF GUM
- J) 5 BATS FOR EVERY 9 BASEBALL PLAYERS

Since the ratios contain terms with different units of measure, it is best to write the units, e.g., 24 inches : 2 feet.

See *Ratios by Picture 2* for a follow-up activity using equivalent ratios.

TYPE: Paper & Pencil

SHADY RATIOS

Introducing Ratio Notation
Getting Started
RATIO

1. A) The ratio of the number of shaded rectangles to the number of unshaded rectangles is 3 to 5. This ratio may be written 3 to 5, 3:5, or $\frac{3}{5}$.

- B) The ratio of shaded rectangles to small rectangles is 3 to 8, 3:8, or $\frac{3}{8}$.

- C) The ratio of small rectangles to unshaded rectangles is 8 to 5, 8:5, or $\frac{8}{5}$.

2. Use the figure to describe a ratio of:

- A) 3 to 6--3 shaded triangles to _____.
B) 6:9--_____ to small triangles.
C) $\frac{9}{3}$ --Small triangles to _____.

Can you find a ratio of 9:1?

3. Use this figure to describe a ratio of:

- A) 5 to 4 _____
B) $\frac{4}{9}$ _____
C) 9:5 _____
D) 1 to 9 _____

The ratio is all small triangles to one large triangle.

SHADY RATIOS (CONTINUED)

4. For the figure on the right write and describe at least 3 ratios.

- A) _____
 B) _____
 C) _____
 D) _____
 E) _____

5. Write the ratio of:

- A) Number of shaded squares to number of unshaded squares.

- B) Number of shaded squares to number of small squares.

- C) Number of small squares to number of unshaded squares.

6. Write the ratio of:

- A) Shaded rectangles to unshaded rectangles.

- B) Small rectangles to shaded rectangles.

- C) Unshaded rectangles to shaded rectangles.

7. Shade to show a ratio of 6 shaded hexagons to 1 unshaded hexagon, 6:1. In how many different ways can this be done?

8. Shade the circles to show a ratio of 7 to 10. In how many different ways can this be done?

RECKONING RATIOS

Using Ratio Notation
Getting Started
RATIO

We can use ratios
to compare the
numbers of two
kinds of things.

The ratio of small triangles to rhombuses is 22 to 11.

We can write this as 22:11.

Determine these ratios:

1) Rhombuses to Small Triangles

_____ to _____ or _____:

2) Hexagons to Rhombuses

_____ to _____ or _____:

3) Small Triangles to Hexagons

_____ to _____ or _____:

4) to _____ to _____ or _____:

5) to _____ to _____ or _____:

6) to _____ to _____ or _____:

7) to _____ to _____ or _____:

8) to _____ to _____ or _____:

9) and to _____ to _____ or _____:

STUDENT RATIOS

Determining Ratios
from Student Data
Getting Started
RATIO

TEACHER DIRECTED ACTIVITY

The students in your class are a resource for many situations that can be expressed as a ratio. Number of blonds, brunettes, redheads; number of girls, boys, students; number of students wearing glasses, not wearing glasses; number of students in band, chorus, intramurals, athletic teams, etc. The possibilities are many.

A chart on the overhead or blackboard can begin the discussion. Leave room for the students to add categories of their own. You might suggest that some categories can be combinations, such as blond girls or redheaded boys.

Category	Number
Total Students	
Girls	
Boys	
Blonds	

When the data has been collected, students can be asked to write ratios such as:

- the number of boys to the number of girls.
- the number of students wearing glasses to the total number of students.
- the number of students liking mathematics to the number of students not liking mathematics.

Again, the possibilities are many. Students can be encouraged to describe situations. An alternative is to write a ratio and have the students describe the situation.

A MASS MEASUREMENT

Determining Ratios
from a Balance Scale
Getting Started
RATIO

Materials needed: Balance scale, six objects varying in mass, set of washers.

- Activity:
- Estimate the mass of the six objects and arrange them in order from heaviest to lightest.
 - Find and record the number of washers needed to balance each of the objects. Did you estimate correctly?
 - Using the number of washers needed to balance the object, write the ratios of the masses of these objects. (Let the heaviest object be A and the lightest be F.)

- (a) A:B (b) C:D (d) C:B (e) F:A (f) E:D
(g) A:C:E (h) F:D:B

See *Happy Ratio Day* for an activity using student birthdays.

TYPE: Activities

RATIO OF AGES

TEACHER DIRECTED ACTIVITY

Using Ratios to Compare
Change in Age
Getting Started
RATIO

Part I:

There are two brothers; Jon is 13 years old, Ron is only 1 year old. As the two grow older the ratio of their ages will change. Neatly organize a chart so the students can compare the ages. Do a few lines and suggest that they continue the pattern until Jon is 24 years old.

<u>Jon</u>	<u>Ron</u>	<u>Ratio of Ages</u>	<u>Times As Old As</u>
13	1	13:1	Jon is 13 times as old as Ron
14	2	14:2	Jon is 7 times as old as Ron
15	3	15:3	Jon is 5 times as old as Ron
16	4	16:4	Jon is 4 times as old as Ron
.	.	.	.
.	.	.	.
.	.	.	.
24	12	24:12	Jon is 2 times as old as Ron

Ask the students if they see any patterns in the chart.

- How old will Jon and Ron be when Jon is 2 times as old as Ron?
- When will Jon be $1\frac{1}{2}$ times as old as Ron?
- If Jon is 100 years old, then he is _____ times as old as Ron.
- If Jon is 500 years old, then he is _____ times as old as Ron.
- When will Jon be 1 times older than Ron?

If students fail to see that the ratio of their ages approaches but doesn't equal 1 another example may be needed. Personalize the activity by selecting a student with a younger brother or sister.

TYPE: Discussion/Chalkboard/Paper & Pencil
IDEA FROM: Searchmath

RATIO OF AGES (CONTINUED)

Part II:

The ratio of ages pattern can be investigated by working backwards in age. Suppose Lynn is 12 years old and Mark is 8 years old.

<u>Lynn</u>	<u>Mark</u>	<u>Ratio of Ages</u>	<u>Times As Old As</u>
12	8	12:8	$1\frac{1}{2}$ times as old as
11	7	11:7	
10	6	10:6	
9	5	9:5	
8	4	8:4	
7	3	7:3	
6	2	6:2	
5	1	5:1	
.	.		
.	.		
.	.		
4	0	nonsense	

Extend the table using months. If calculations become too burdensome use calculators.

60	12	60:12	5 times as old as
59	11	59:11	
58	10	58:10	
57	9	57:9	
56	8	56:8	7 times as old as
55	7	55:7	
54	6	54:6	9 times as old as
53	5	53:5	
52	4	52:4	13 times as old as
51	3	51:3	17 times as old as
50	2	50:2	25 times as old as
49	1	49:1	49 times as old as

? Change Lynn's and Mark's ages to days and continue the countdown. When will Lynn be 100 times as old as Mark? . . . 1000 times as old as Mark? . . . 10,000 times? 1 million times? (Try hours and minutes.)

RATES ARE RATIOS

Identifying Different
Rates
Rate
RATIO

A rate is a special kind of ratio. With the rate the two measures being compared have different units, and the units cannot be converted to one another. One common rate is the rate of speed, 55 miles per hour. This means the ratio of miles traveled to the number of hours spent traveling is 55 miles to 1 hour, or 55 mph.

PATTERN GAMES

I

Determining Rates
Rate
RATIO

At the bottom of the page are 40 numbers. By placing your finger on each circle touch each number in order starting at 1. You will have at most 1 minute. Don't start until you hear "Go" and stop immediately when you hear "Time's Up." In the table record the number you finish on and the time in seconds. If you finish before one minute, stop and record your time. Write your rate in the table. See if you can improve your rate with each trial.

This activity could be done with an entire class or small groups. If students finish before a minute is up, a provision must be made to tell them their time.

A suggestion is to use the numbers from 1 to 60 on the blackboard by systematically pointing to them as the time elapses. When the student finishes the activity he can check the blackboard for the time. After the first trial the students can be asked if they noticed a pattern. After the second trial the pattern could be discussed. Does knowledge of a pattern improve the rates?

Trial	Number	Seconds	Rate = Number:Seconds

MATH IS A FOUR-LETTER WORD

Determining Rates
Rate
RATIO

- A.
- Look at the four-letter words and 4-digit numerals on the next page.
 - Record in the table an estimate of how many words you could copy by printing for 15 sec., 30 sec., 1 minute.
 - Check your estimate by copying words as your partner times you. Don't copy the same word twice.
 - Record your results in the table. Write your rate.
 - Are the three rates for 15 sec., 30 sec. and 1 minute equivalent? _____
 - How many words could you copy in 5 minutes? _____

	Time in seconds			Rate = Number copied: time in seconds			Rate = Number copied: time in seconds			Rate = Number copied: time in seconds		
	Estimate of words copied by printing			Estimate of words copied in cursive			Estimate of numerals copied			Estimate of numerals copied		
	Number of words copied by printing			Number of words copied in cursive			Number of numerals copied			Number of numerals copied		
15 sec.			:			:			:			:
30 sec.			:			:			:			:
60 sec.			:			:			:			:

- B.
- Repeat A, except this time copy in cursive writing.
 - Record in the table.
 - How does your printing rate compare to your cursive rate? _____
- C.
- Repeat the same procedure, except copy from the list of 4-digit numerals.
 - Record in the table.
 - For which of the three activities is your rate the best? _____
 - Why do you think your rates differ? _____

DID YOU KNOW . . . Monks used to copy the Bible by hand. Using your rate, how long would it take you to copy the Bible?

Extensions:

- Have students copy words from a page in an encyclopedia. Compare this rate with the ones above.
- Have students estimate how many words a typist could type in one minute from (a) the word list, (b) the numeral list, and (c) the encyclopedia. Ask the school secretary to help check the estimations. Students could compare the typing rate for one minute to their cursive and printing rates.
- If someone in the building can take shorthand, have the person write on the overhead as you read from a student textbook. Find the rate per minute. The person should read back the transcription to the class as they check their textbooks for accuracy.

SPY ON THE EYE (OR GAZE ON THE GUM)

Determining Rates
Rate
RATIO

If your school allows gum chewing this activity can be adapted to chews per minute.

Materials Needed: Clock with a second hand
2 secretive, spying students

- Activity:**
- (1) For 1 minute count the number of blinks your partner makes and record blinks per minute in the table. Ask your partner to blink in a natural way.
 - (2) Have your partner find your rate of blinking.
 - (3) Move to a bright area--near the window, near a lamp, in the sunshine--and find out if the blinking rates increase.
 - (4) Secretly find the blinking rate of 4 other students, 2 girls and 2 boys. Record.
 - (5) Do the same for your teacher.
 - (6) Find and record the blinking rate of someone wearing contact lenses.

You	Partner	You(bright)	Partner(bright)	Girl #1	Girl #2	Boy #1	Boy #2	Contacts	Teacher
bpm	bpm	bpm	bpm	bpm	bpm	bpm	bpm	bpm	bpm

- (7) Is there any difference in the blinking rate of boys and girls?
- (8) Is the blinking rate of the student wearing the contact lenses faster than the other rates? Why?
- (9) Use your blinking rate to find the number of blinks you will make in a day? a year?
- (10) If your eyelids move 2 cm in a blink (1 cm in closing and 1 cm in opening), how far will your eyelids move in a day?

TYPE: Activity

LET YOUR FINGERS DO THE WALKING

Determining Rates
Rate
RATIO

Materials needed: Telephone book, paperback novel, catalog, stopwatch or clock with a second hand.

Activity:

- (1) Turn the pages in the telephone book one page at a time. Have a partner time you for 1 minute. Record the number of pages turned per minute in the table below. Now time your partner as he/she turns the pages. Record in the table.
- (2) Repeat the activity with the paperback novel. Record both rates in the table.
- (3) Repeat the activity with the catalog.
- (4) With which book did you get the fastest rate? _____ your partner? _____
- (5) What are some reasons why the rates might differ?

	You	Partner
Telephone book	pages per min.	pages per min.
Paperback book	p.p.m.	p.p.m.
Catalog	p.p.m.	p.p.m.

Students will have to agree on a method for turning pages.

TYPE: Activity

THE FRENCH BREAD

PROBLEM: TEACHER DEMONSTRATION

Determining Rates
Rate
RATIO

French bread comes in many sizes and shapes. Some loaves are fat and round. Some loaves are braided or odd-shaped. Other loaves are long and thin, about 1 to 2 metres long.

Bring a 60 cm loaf of French bread to class. Cut the loaf into two equal pieces. How long would each piece be? (30 centimetres)

How long would each piece be if the loaf was divided into three equal pieces? (20 centimetres)

Make a chart on the chalkboard (or overhead transparency) and list the answers that students give.

Number of Pieces	Rate	
2	$\frac{60}{2}$	30 centimetres per piece
3	$\frac{60}{3}$	20 centimetres per piece
4	$\frac{60}{4}$	15 centimetres per piece
5	$\frac{60}{5}$	12 centimetres per piece
6	$\frac{60}{6}$	10 centimetres per piece
.	.	.
.	.	.
.	.	.

Have students continue the pattern for a while.

- How many pieces of bread will there be in the loaf if each piece is two centimetres thick?
- Bread is sliced about one centimetre thick to fit into a toaster. How many pieces of toast could be made from the loaf if each piece was one-centimetre thick? $\frac{1}{2}$ -centimetre thick? (Have students follow the pattern in the chart if they do not know how to find the answer.)
- 150 pieces of toast are needed for a large breakfast. About how many 60-centimetre loaves of French bread would be needed?
- 1 out of every 5 pieces of toast is too dark to serve. How many pieces out of the 150 slices of toast are too dark? _____ How many more loaves will be needed to get enough toast? _____

TYPE: Activity

FIX THAT LEAK

Determining Rates
Rate
RATIO

Materials needed: Graduated beaker
Clock with a second hand
Calculator, if available

- Activity:** (1) (a) Turn on a faucet so it drips at a steady rate.
(b) Count the number of drops falling from the faucet in 30 seconds.
Repeat the count for accuracy.
The water is dripping at a rate of _____

_____ drops per minute.
_____ drops per hour.
_____ drops per day.
_____ drops per year.

- (2) (a) Measure the volume of 100 drops of water in millilitres.
(b) Use the data above. The faucet is dripping at a rate of _____

_____ millilitres per minute.
_____ millilitres per hour.
_____ millilitres per day.
_____ millilitres per year.

- (c) The last rate is equivalent to a rate of _____ litres per year.

- (3) Call your local water board to find the rate charged for residential water use. (The rate will probably be dollars per 1000 gallons of water. 1 litre $\approx$.2624 gallons.) How much money is wasted by this dripping faucet in one year?

Extensions: (1) Assume 10% of the dwellings in your city have leaky faucets which drip at the same rate. Project the drops, litres and cost for your city. (2) Call a plumber to find the cost for repairing the leak. (3) Relate the amount of water leaked in one year to the capacity of a well-known building or structure.

TYPE: Activity

AS THE RECORD TURNS

Determining Rates
Rate
RATIO

E
S
I

Materials needed: Record player with variable speeds
Several popular $33\frac{1}{3}$ albums, 45 singles and a 78 record (if available)
Stopwatch or clock with a second hand.

Questions: How fast does a record turn?
What do the speeds on a record player mean?

MARKER

- I. Place a small marker on the outer edge of a $33\frac{1}{3}$ record album. Set the record player to $33\frac{1}{3}$ and carefully count the number of revolutions the marker makes in 1 minute. Make a table like the one below and record the number. Repeat the count two more times for accuracy.

	Number of revolutions
minute 1	_____
minute 2	_____
minute 3	_____

Find the sum of the revolutions. _____

Find the average by dividing by 3. _____

MARKER

- II. Repeat the activity again using a 45 record.
- III. If you have a 78 record, repeat the activity again.
- IV. Place a small marker on the label of a $33\frac{1}{3}$ album. Repeat the activity. Find the average for the marker on the label.

The speed is still $33\frac{1}{3}$ rpm. Because the inside marker travels a shorter distance, it appears to move slower.

TYPE: Activity

AS THE RECORD TURNS

(CONTINUED)

TEACHER PAGE

The following are additional activities and questions that can be used as a follow-up to the *As the Record Turns* student page.

- (a) Play a $33\frac{1}{3}$ album at 45 rpm. How is the sound distorted? How many times faster is the record revolving compared to its normal speed?
- (b) Play a 45 single at $33\frac{1}{3}$ rpm. How is the sound distorted? How many times slower is the record revolving compared to its normal speed?

Note: Most record players have a different needle setting for 78 rpm records, so you should not try to play one of these records at a different speed.

- (c) Measure the time a song plays at its normal speed. (This figure can also be found on the label.) Compute the time of the same song played at a slower or faster speed.
- ? (d) If a song takes 3:30 minutes ($3\frac{1}{2}$ minutes) to play at 45 rpm, how many revolutions does the record make?
- ? (e) If it takes 21 minutes to play one side of an album at $33\frac{1}{3}$ rpm, how many revolutions does the turntable make?

Did you know that . . .

- the first needle used to play records was a cactus needle?
- 78 rpm was the first speed used for records because it seemed like a convenient speed?
- RCA tried to corner the market on records when they patented the 45 rpm single record with the large center hole?
- with the invention of more refined and sharper needles, records could be made with finer grooves which played best at $33\frac{1}{3}$ rpm?
- some commercials played on radio stations run at 16 rpm and start from the center and play to the outside?

MY HEART THROBS FOR YOU

Using Rate of Heartbeat
to Determine Physical
Fitness
Rate
RATIO

Materials Needed: 2 students
Stopwatch or clock with a second hand

Activity: 1. On your paper draw a chart like the one below.

Name	Inactive Pulse		Active Pulse		Recovery Pulse	
	Self	Partner	Self	Partner	Self	Partner

2. a) Guess how many times your heart beats in one minute. _____ bpm (beats per minute)
- b) Have your partner take your pulse and record it in the inactive column as _____ bpm.
- c) Take and record your partner's pulse.
3. a) Run in place for two minutes.
- b) Record your pulse rate in the active column.
- c) Have your partner run in place for two minutes.
- d) Record your partner's pulse rate.

Alternative activities might be sit-ups, push-ups, jumping jacks, walking fast, etc.
REST 5 MINUTES

4. a) Record both of your pulse rates in the recovery column.
- b) Have your pulses returned to normal?
- c) Is your recovery rate faster than your partner's?

A class discussion about physical conditioning and the effects of exercise could follow this activity. For ideas and information see *Step Right Up*.

TYPE: Activity

STEP RIGHT UP

TEACHER IDEAS

Using Rate of Heartbeat
to Determine Physical
Fitness

Rate
RATIO

Numerous ads to eat wisely and exercise regularly encourage students to think about their physical condition which, in turn, affects the pulse and recovery time following exercise. In general conditioned persons have a slower resting pulse and a slower pulse during exercise. Their pulse will recover to the resting rate quicker following strenuous exercise than persons who are in poor condition. Because of heredity some persons inherit efficient hearts with slower rates, while others are born with relatively inefficient hearts. However, both types can be improved.

Since the physical condition of an individual affects his heartbeat, pulse tests can be used to measure physical fitness. Four pulse tests are described below, and tables to interpret the results are provided. Better results could be obtained from the first two tests if they are done at home with parental help.

I. Pulse Lying:

The pulse lying is the slowest, resting pulse of a person. The student can find this rate by taking her pulse for 30 seconds before she gets out of bed in the morning. If done in class, have the student lie down and attempt to completely relax for ten minutes. In the lying position count her heartbeats for 30 seconds. The student should continue to rest in the lying position for 2 more minutes and repeat the count. If it is the same double the count to get the pulse lying, and record the number. If less the student should rest longer and repeat the count.

II. Pulse Standing:

To obtain the slowest, resting, standing pulse have the student rise slowly after finishing the pulse lying test and remain standing for two minutes. Count the heartbeats for 30 seconds and double the number to get the pulse standing.

Have the student subtract the pulse lying from the pulse standing. This number is the pulse difference. By checking Table A the student can find her physical fitness rating.

TABLE A

Physical Fitness Rating	Excellent		Very Good		Above Average		Average		Below Average		Poor		Very Poor						
Pulse Lying	40	54	57	58	60	63	66	69	71	73	75	77	78	79	80	82	84	86	105
Pulse Standing	46	63	67	68	70	74	77	80	83	85	87	90	91	92	94	96	98	101	123
Pulse Difference	6	9	10	10	10	11	11	11	12	12	12	13	13	13	14	14	14	15	18

TYPE: Activity

IDEA FROM: Physical Fitness Workbook

STEP RIGHT UP

(CONTINUED)

III. Simplified Pulse Ratio Test:

- While sitting, have the student count and record her heartbeats for one minute.
- Have the student face a chair (approximately 45 cm high) and step up with the left foot, up with the right, down with the left, and down with the right. The student should do 30 of these steps in one minute. In order to set the cadence the teacher or another student can call out "up, up, down, down" at the required speed or play a taped recording of the cadence.
- Immediately after completing the 30 steps, the student should sit, count and record her heartbeats for two minutes.
- Have the student write her pulse ratio. $\text{Pulse Ratio} = \frac{\text{Heartbeats for 2 minutes following the exercise}}{\text{Heartbeats for 1 minute before exercise}}$. Simplify the ratio by dividing the first number by the second, correct to one decimal place. Check Table B to find the physical fitness rating.

TABLE B

Pulse Ratio	Physical Fitness Rating
1.5 - 1.7	Excellent
1.8 - 2.0	Very Good
2.1 - 2.3	Above Average
2.4 - 2.5	Average
2.6 - 2.8	Below Average
2.9 - 3.1	Poor
3.2 - 3.4	Very Poor

IV. Three Minute Step Test:

This test is administered like the previous test, except the student steps for three minutes, and the cadence is 24 steps per minute. In addition wait one minute after the student completes the exercise and count the heartbeats for only 30 seconds. The efficiency score is the ratio of

$$\frac{\text{number of seconds stepping} \times 100}{\text{pulse for 30 seconds} \times 5.6}$$

Divide and check Table C to find the physical fitness rating.

TABLE C *

Efficiency Score	Physical Fitness Rating
72 - 100	Excellent
62 - 71	Very Good
51 - 61	Good
41 - 50	Fair
31 - 40	Poor
0 - 30	Very Poor

*This table is accurate for junior high girls. The efficiency scores may need to be raised for junior high boys. At the grade school level there is not much difference between boys and girls.

TEACHER DIRECTED ACTIVITY

Determining Rates
Rate
RATIO

Materials Needed: Records and record player, clock with second hand, metronome, piano, drums, guitar, flute or other instruments, sheet music.

- I. (a) Select several musical pieces that have different tempos (beats per minute), for example, a slow country western song, a Sousa march, a rock and roll piece, and a classical arrangement. Ask your students to bring some of their records to play.
- (b) Have the students determine the tempo of the song by counting the number of beats in 10 seconds. The students can keep time with the music and count the beats by tapping their feet or hands, dancing, or setting a metronome.
- (c) Have the students repeat the count to check for accuracy and record the results in the table as a rate; number of beats : 10 seconds.
- (d) Rewrite the rate and express it in the table as number of beats : 60 sec.
- (e) Look at the record to find the total time of the song and record the time in the table.
- (f) Estimate and record the total number of beats in the song.

Musical Selection	Number of beats: 10 sec.	Number of beats: 60 sec.	Total time of song	Estimate of total number of beats
1. _____	: 10 sec.	: 60 sec.	_____	_____
2. _____	:	:	_____	_____
3. _____	:	:	_____	_____
4. _____	:	:	_____	_____
5. _____	:	:	_____	_____
6. _____	:	:	_____	_____

- II. Have a student or the music teacher play a selection at various tempos. Use a metronome to determine the tempo.

A student with a set of drums could keep the beat. Time a song at a specified tempo and record the time in the table. Select a new tempo and estimate the new time for the song. Check the estimate by having the musician play the song at the new tempo.

Musical Selection	Tempo = beats: 1 minute	Total time of song	New tempo = beats: 1 minute	Estimated time of song
1. _____	:	_____	:	_____
2. _____	:	_____	:	_____
3. _____	:	_____	:	_____
4. _____	:	_____	:	_____

- III. Select some sheet music. Read the tempo suggested on the music. Have a student estimate the tempo by tapping his foot. Check the estimate with the metronome. Have the musician play the selection.

WHICH IS A BETTER BUY?

Using Rates to Compare
Prices
Rate
RATIO

E
S
I

This page can be used to encourage discussion of unit pricing and wise buying habits. These examples are meant to be open-ended to allow for some problem solving. Possible answers for each graphic are provided. The examples can also be used as a starting point for other problems, e.g., what is the price for 12 coffee mugs cost?; what is the price for 1 pen?

The cups are of equal quality so the cups costing 6 for \$4.98 are a better buy.

Given the same price, the larger and regularly shaped apples are probably a better buy, because of less wasted core, etc.

Does the buyer want quality or quantity? Will the better pens last longer and perform better than the cheaper pens?

Other items, relevant to middle school students, could be used to extend this page. Bicycles, footballs (or other sports equipment), candy or gum, notebooks and food items like pizza or pop could be used.

What are the reasons for buying the corn--for a meal or for canning? Does the buyer have a freezer? Is the buyer going to a large family reunion?

TYPE: Transparency/Bulletin Board

WHICH IS BETTER ?

Using Rates to Compare
Prices

WHICH IS BETTER? 2

Using Rates to Compare Prices

In this activity either the quantity or the cost is a multiple of the other quantity or cost. A solution strategy might be: 2 candy bars for 15¢ is the same as 4 for 30¢, so the other rate of 4 for 25¢ is better.

Rate
RATIO

2 for 15¢ 4 for 25¢	50¢ 1.49¢
\$2.50 \$1.30	.45 \$1.35
6 CANS OF DOD FOR 78¢ OR 24 CANS OF DOD FOR \$2.98	\$7 for 12 \$22 for 36
\$15 for 6 yds \$5 for 1 1/2 yds	18 gals \$10.80 OR 9 gals \$5.40
10 EARS OF CORN AT \$1.00 OR 80 EARS AT \$7.50	50 lbs. of potatoes AT \$4.00 OR 10 lbs. AT \$.80

TYPE: Transparency/Paper & Pencil

BUT I ONLY WANT ONE

Using Rates to
Compare Prices
Rate
RATIO

E
S

Find the unit cost
(cost of one item) if:

A. 3 tennis balls cost \$2.67

B. 2 dozen pencils cost \$1.68

C. a 6-pack of pop cost \$1.14

D. 1 dozen eggs cost \$.96

E. 3 T-shirts
cost \$3.36

F. 5 pounds of hamburger
cost \$3.45

Find the better buy by finding the unit cost,
for example cost per ounce.

G. 12 oz. of soap for \$1.32
or 15 oz. for \$1.50

H. 10 oz. of potato chips for
80¢ or 16 oz. for \$1.12

I. \$7.55 for 5 lbs. of steak or
\$4.50 for 3 lbs. of steak

J. 4 qts. of milk for \$1.24 or
7 qts. of milk for \$2.24

K. \$20.98 for 2 pairs of jeans
or \$31.77 for 3 pairs of
jeans

I NEED A JOB LIKE THAT!

RATIO

£
/\$
I

Mr. Pennypusher, I have a 20-day job for you to do, but I cannot pay you very much.

That's ok, Mr. Pushover. How about paying me 1 penny the first day, 2 pennies the second day, 4 pennies the third day, 8 pennies the fourth day, and so on for the 20 days?

Sounds like a good deal to me.

Yes, it is a good deal.

For me!
Ha! Ha!

Fill in this chart of earnings for Mr. Pennypusher. Use a calculator to get each day's wages and the total earnings for all 20 days.

DAY	EARNINGS	DAY	EARNINGS
1	\$.	11	\$.
2	\$.	12	\$.
3	\$.	13	\$.
4	\$.	14	\$.
5	\$.	15	\$.
6	\$.	16	\$.
7	\$.	17	\$.
8	\$.	18	\$.
9	\$.	19	\$.
10	\$.	20	\$.
TOTAL FOR 20 DAYS		\$.	

a) What is the average amount Mr. Pennypusher made per day? (Divide the total earnings by 20.)

b) If he worked 8 hours per day, what is the average amount he made per hour?

c) How much did Mr. Pennypusher average per minute?

(d) If you were paid as much as Mr. Pennypusher averaged per minute, how much would you make for the time you are in your mathematics class?

per day? _____

per week? _____

per school year? _____

RATIOS AND CUBES 1

Generating
Equivalent
RATIO

E
S
I

Materials: 24 blue cubes and 24 red cubes

Activity:

B means blue cube.
R means red cube.

A. Use 1 B and 2 R.

1. The ratio of B to R is 1:2.

Use another group of 1 B and 2 R.

2. The ratio of B to R is now 2:4.

Use another group of 1 B and 2 R.

3. The ratio of B to R is now 3:6.

4. If you continued using groups of 1 B and 2 R,
write the ratio of B to R that you would get.

6:12, 12:24, 18:36, 24:48

Each ratio was formed using groups of 1 B and 2 R.
The ratios are equivalent ratios.

B. Use 4 R and 3 B.

1. The ratio of R to B is 4:3.

Use another group of 4 R and 3 B.

2. The ratio of R to B now is 8:6.

Use another group.

3. The ratio of R to B is now 12:9.

4. Continue using groups of 4 R and 3 B.

Write the ratio of R to B.

16:12, 12:9, 20:15, 24:18

Each ratio was formed using groups of 3 R and 4 B. The ratios are equivalent ratios.

C. Use these groups and write equivalent ratios.

① 3:5, 9:15, 15:25

② 1:4, 5:20, 12:48

③ 8:3, 16:6, 32:12

RATIO

E
S
T

Materials: 24 blue cubes and 24 red cubes

B means blue cube.
R means red cube.

Activity:

A. Use 8 B and 16 R.

1. The ratio of B to R is $\frac{\quad}{\quad}$.
Separate each color into two equal groups.
2. Using one group of each color, the ratio of B to R is $\frac{\quad}{\quad}$.
Separate each group into two smaller groups.
3. Using one smaller group of each color, the ratio of B to R is $\frac{2}{\quad}$.
Separate again.
4. Using one group of each color, the simplest ratio of B to R is $\frac{\quad}{\quad}$.
The ratios above are equivalent ratios.
Each can be formed using $\frac{\quad}{\quad}$ B and $\frac{\quad}{\quad}$ R.

B. Use 24 R and 18 B.

1. The ratio of R to B is $\frac{\quad}{\quad}$.
Separate each color into three equal groups.
2. Using one group of each color, the ratio of R to B is $\frac{\quad}{\quad}$.
Separate each group into two smaller groups.
3. Using one smaller group of each color, the ratio of R to B is $\frac{\quad}{\quad}$.
Separate again.
4. Using one group of each color, the simplest ratio of R to B is $\frac{\quad}{\quad}$.
The ratios above are equivalent ratios.
Each can be formed using $\frac{\quad}{\quad}$ R and $\frac{\quad}{\quad}$ B.

C. Find the simplest ratio that could be used to form these equivalent ratios.

RATIO

1.
 - a) How long is the fish? _____
 - b) How long is the snake? _____
 - c) Write a ratio to compare the length of the snake to the length of the fish _____:_____.
 - d) How many fish placed end-to-end would be needed to have the same length as the snake? _____
 - e) The snake is _____ times as long as the fish.
 - f) Find two lengths on the ruler, so the longer length is 3 times the shorter length. _____ and _____
 - g) What are the two shortest lengths (whole number of centimetres) on the ruler, so that the longer is 3 times the shorter? _____ and _____
 - h) Write the ratios from (e) _____:_____, (f) _____:_____ and (g) _____:_____. These ratios are called equivalent ratios. Can you see why?
 - i) Write another ratio equivalent to the ratios in (h) _____:_____.

2.
 - a) Write a ratio to compare the lengths of the gerbil to the snake _____:_____.
 - b) The gerbil is _____ times as long as the snake.
 - c) Find two lengths on the ruler, so the shorter length is $\frac{1}{2}$ of the longer length and write their ratio _____:_____.
 - d) Find the two shortest lengths, so the shorter length is $\frac{1}{2}$ of the longer length. _____ and _____
 - e) Write the ratios from (a) _____:_____, (c) _____:_____, (d) _____:_____. These ratios are equivalent ratios because the shorter length is $\frac{1}{2}$ of the longer length in each case.
 - f) Write another ratio equivalent to the ratios in (e) _____:_____.

3.
 - a) Write a ratio to compare the length of the gerbil to the length of the fish. _____:_____
 - b) The gerbil is _____ times as long as the fish.
 - c) Find two lengths, so the longer is $1\frac{1}{2}$ times the shorter. _____ and _____
 - d) Find the two shortest lengths, so the longer is $1\frac{1}{2}$ times the shorter. _____ and _____
 - e) Write the ratios from (a) _____:_____, (c) _____:_____, (d) _____:_____. These ratios are equivalent ratios because the longer is $1\frac{1}{2}$ times the shorter.
 - f) Write another ratio equivalent to the ratios in (e) _____:_____.

EQUIVALENT RATIOS WITH GEOMETRIC MODELS

TEACHER PAGE

Concept
Generating
Equivalent
RATIO

A series of equivalent ratios can be generated by keeping the shaded area and total area of a figure constant but changing the number of parts.

EXAMPLE 1

EXAMPLE 2

EXAMPLE 3

Sample questions in example 1 might be:

- 1) Has the shaded area changed?
- 2) Has the size of the square changed?
- 3) Can you see a ratio of 1:3 in each diagram?

Student worksheets can be developed to:

- a) have the students shade the figures to represent the equivalent ratios.

- b) partition the figures to show the equivalent ratios.

These activities can give an intuitive feeling for generating equivalent ratios by the algorithm of multiplying both terms of the ratio by some number. The models show how the number of shaded parts and total parts are both doubled, tripled, etc.

THE QUIZ

Generating
Equivalent
RATIO

Results of Quiz 1:

Joe 3 right - 2 wrong
Sally 3 right - 2 wrong
Jean 3 right - 2 wrong
Tammy 3 right - 2 wrong
Bob 3 right - 2 wrong
Pete 3 right - 2 wrong
Mary 3 right - 2 wrong

In fact, every one of the 22 students in the class got 3 right and 2 wrong.

Fill in the chart for the first 8 students.

NUMBER OF STUDENTS	NUMBER RIGHT	NUMBER WRONG	RATIO OF NUMBER RIGHT TO NUMBER WRONG
1	3	2	3 : 2
2	6	4	6 : 4
3		6	: 6
4			
5			
6			
7			
8			

- a) For 4 students the ratio of the total number right to the total number wrong is ____ : ____.
- b) For 15 students the ratio of the total number right to the total number wrong is ____ : ____.
- c) For all 22 students the ratio of the total number right to the total number wrong is ____ : ____.

No matter how many students are used, there are always groups of 3 right answers for every 2 wrong answers. Because of this the ratios in the chart and in the questions are called equivalent ratios.

d) Write a ratio equivalent to 3 rights to 2 wrongs for:

1) 12 students 36 : ____ 2) 16 students ____ : ____ 3) 21 students ____ : ____

On a second quiz all students got 9 right and 1 wrong. Make and fill in a chart like the one above for this quiz.

IDEA FROM: Activities in Mathematics,
2nd Course

EQUIVALENT RATIOS BY PATTERNS

TEACHER IDEA

Concept
Generating
Equivalent
RATIO

Developing the concept of equivalent ratios by using patterns can be accomplished as a bell work, warmup, or mental arithmetic drill at the beginning of class. These activities can be started in advance of the introduction of ratio notation by presenting problems with different word phrases in place of the colon.

Examples of problems which can be prepared for an overhead or the blackboard might be:

- 1) \$ 4 for 1 hour's work.
\$ 8 for ___ hour's work.
\$12 for ___ hour's work.
___ for 4 hour's work.
___ for ___ hour's work.
___ for ___ hour's work.
- 2) 30 students for every 1 class.
___ students for every 2 classes.
___ students for every 5 classes.
300 students for every ___ classes.
___ students for every ___ classes.
___ students for every ___ classes.

Various ratio notations and ratio tables can be used. The problems might start with the "unit quantity" given (see 3, 4, 5) and then develop into ones where the "unit quantity" must be found (see 6, 7, 8).

- 3) 1 to 4
2 to ___
___ to 12
4 to ___
5 to ___
___ to ___
___ to ___
- 4) 2:1
4:___
___:3
___:4
10:___
___:___
___:___
- 5) $\frac{1}{5}$, $\frac{1}{10}$, $\frac{4}{40}$, $\frac{16}{40}$, —, —
- 6) 2:16
1:___
3:___
8:___
___:___
___:___
- 7) 18 to 6
___ to 1
12 to ___
___ to 5
___ to ___
___ to ___
- 8) $\frac{10}{20}$, $\frac{1}{8}$, $\frac{12}{8}$, —, —

Rates that students would be familiar with can be given in the form of ratio tables (see 9, 10, 11).

9)

miles	50	100		200	250		
hours	1		3				

10)

typed words	43	172		86			
minutes	1		10		5		

11)

pounds of meat	4	1	2				
cost	\$6.00			\$4.50	\$12.00		

In each problem provide a few blanks for students to write their own equivalent ratios. The development of this technique will be useful in the solution of simple proportion problems, such as: A bagger in a supermarket works 2 1/2 hours and earns \$8. How much would the bagger make in 10 hours? 1 hour?

This type of solution avoids work with cross products and division using fractions.

Possible Solutions: 2 1/2 hours at \$8
5 hours at \$16
10 hours at \$32
1 hour at \$3.20

TYPE: Activity

Grade 6

EATING CONTEST

Generating
Equivalent
RATIO

Harry, Morgan, and Eddy had a hamburger eating and milkshake drinking contest.

Part of each chart is blank.
You may fill in more numbers
or, if you want the students
to generalize, use a variable.

- 1) Harry ate 2 hamburgers for every 1 hamburger Eddy ate.
 - a) Who ate more hamburgers? Harry or Eddy? _____
 - b) How many hamburgers did Harry eat during the contest? _____
 - c) Fill in this chart of possibilities.

NUMBER OF HAMBURGERS HARRY ATE	2	4			10			26			
NUMBER OF HAMBURGERS EDDY ATE	1		3	4		7	10				

- 2) Morgan drank 3 milkshakes for every 1 milkshake Harry drank.
 - a) Who drank the most milkshakes? Harry, Morgan or Eddy? _____
 - b) Fill in this chart of possibilities.

NUMBER OF MILKSHAKES MORGAN DRANK	3		9	12			18				
NUMBER OF MILKSHAKES HARRY DRANK	1	2			5	8		11			

- 3) Harry ate 4 hamburgers for every 1 hamburger Morgan ate.
 - a) Fill in this chart of possibilities.
 - b) Who ate more hamburgers? Morgan or Eddy? _____

NUMBER OF HAMBURGERS MORGAN ATE	1		3		5	7					
NUMBER OF HAMBURGERS HARRY ATE	4	8		16			24	36			

- 4) Use the information in the problems above to fill in this chart of possibilities.

NUMBER OF HAMBURGERS MORGAN ATE	1	2			5						
NUMBER OF HAMBURGERS HARRY ATE				16			40				
NUMBER OF HAMBURGERS EDDY ATE			6			16		12			

TYPE: Paper & Pencil

REDOING RATIOS

Generating
Equivalent
RATIO

Here is a diagram showing two strips of different lengths. The ratio of the lengths of the two strips is $1:2\frac{1}{2}$.

1 Unit

$2\frac{1}{2}$ Units

This diagram shows the same two strips divided into half units.

2 Half Units

5 Half Units

Ratios are usually written with whole numbers. The ratio for the top diagram, $1:2\frac{1}{2}$, can also be written as $2:5$.

1. This diagram shows the ratio $1:1\frac{1}{3}$.

By dividing each unit into thirds, the ratio of the lengths of the strips can be written ____:____.

1 Unit

$1\frac{1}{3}$ Units

2. Use a metric ruler, add lines to these diagrams and write the ratios of the lengths with whole numbers.

1 Unit

$1\frac{1}{4}$ Units

____:____

1 Unit

THE OLD BALL GAME

Determining and
Comparing
Equivalent
RATIO

E
S
I

Because of rainy weather Adams JHS has played only 10 baseball games and won 6. Burnell JHS has won 4 of 6 games, and Cale JHS has won 7 games out of 15.

According to their records, can you tell which is the best team?

- ① Write a ratio for the number of games won to the number of games played for each team.

Adams ___ : 10 Burnell ___ : ___ Cale ___ : ___

- ② Assume the teams will continue to win at the same rate, and write an equivalent ratio for each, showing the record after 30 games have been played. (Why are 30 games used to compare the ratios? Could another number be used?)

Adams ___ : ___ Burnell ___ : ___ Cale ___ : ___
 ___ : 30 ___ : 30 ___ : 30

- ③ Now, which is the best team? _____

- ④ What number of games can be used to write equivalent ratios for these three teams? _____

TEAM	GAMES WON	GAMES PLAYED	RATIO	EQUIVALENT RATIO
DAWSON JHS	15	20	:	:
ELLIS JHS	18	25	:	:
FORD JHS	8	10	:	:

Which team has the best record? _____

⑤

NAME	HITS	TIMES AT BAT	RATIO	EQUIVALENT RATIO
AL	6	25	:	:150
BILL	4	15	:	:150
CLYDE	7	30	:	:150
DON	2	10	:	:150

If each player continues to hit at the same rate, who will have the most hits after 150 times at bat? _____

Explain why 150 is used to write the equivalent ratios.

Check the newspaper to find out how league standings and batting averages are written. Can you figure out what these mean?

RECTANGLE RATIOS

Determining
Equivalent
RATIO

Materials needed: Metric measuring tape, metre stick, and/or metric ruler.

Activity:

On your paper make a chart like the one below.

The objects listed are suggestions. Different objects may be chosen.

- I.** Measure and record the lengths and widths of 5 objects in the shape of rectangles in your classroom. For large objects, measure correct to the nearest decimetre and for small objects measure to the nearest centimetre.

RECTANGLE	LENGTH	WIDTH	RATIO OF LENGTH TO WIDTH
Book			
Floor Tile			
Student Desk			
Filing Cabinet			

- II.**
- Without measuring, make an estimate of the ratio of the length to the width of the door to your classroom. _____
 - Measure the length and width and find the actual ratio. _____
 - Use the width of the door. What would the length be if the ratio of the length to the width is:

2:1? _____

3:1? _____

5:1? _____

- III.**
- Measure the height of the chalkboard. _____
 - What would the length be if the ratio of the length to the height is:

6:1? _____

4:1? _____

- IV.**
- Measure the length of the top of your teacher's desk. _____
 - What would the width be if the ratio of the length to width is:

2:1? _____

3:1? _____

PATIO DOMINOES

Recognizing
Equivalent
RATIO

For information on the construction of Dominoes see the next page.

Wanted:

- 2 or more players
- Set of ratio dominoes
- 1 gallon of enthusiasm

These are the rules:

- a) All dominoes are placed face down on the table.
- b) Each player draws 5 dominoes one at a time.
- c) The player drawing the largest double (equivalent ratio on both parts of the domino) plays it in the middle of the table. If no player gets a double in the first 5 draws all players continue to draw in turn until someone gets a double.
- d) The next player to the left tries to play a domino on the end of the double. If a play cannot be made, the player draws extra dominoes until he can play. Play continues to the left.

This domino can be played on either end of the double.

- e) All doubles (except the first) are placed at right angles to give more places to play.

- f) The first player to play all of his dominoes is the winner.

RATIO DOMINOES (CONTINUED)

CONSTRUCTION HINTS

- A suggested size is 3 cm by 6 cm.
- The dominoes can be made from note cards, tagboard, poster board, or scraps of lumber. (Perhaps you have a student that would like to cut the lumber as an extra project.)
- The following are suggestions for a set of 45 dominoes made using the ratios 1:2, 1:3, 1:4, 1:5, 1:6, 1:7, 1:8, 1:9, 1:10. Of course, you may choose any set of ratios that you want. Each is paired with an equivalent ratio to form nine doubles. Then each is paired with all other ratios to form the remainder of the dominoes.
- For each ratio the three ratio notations should be used, 1 to 2, 1:2, and $\frac{1}{2}$, and also two equivalent ratios are needed, say 5:10 and 50 to 100.
- Suggested pairings for the 45 dominoes.

<u>1:2</u>	<u>1:3</u>	<u>1:4</u>	<u>1:5</u>	<u>1:6</u>
$\frac{1}{2}$, 1 to 2	1:3, $\frac{1}{3}$	$\frac{1}{4}$, 2 to 8	1 to 5, $\frac{20}{100}$	1:6, $\frac{2}{12}$
$\frac{50}{100}$, $\frac{1}{3}$	$\frac{3}{9}$, 1 to 4	$\frac{25}{100}$, $\frac{20}{100}$	1 to 5, 1 to 6	$\frac{6}{36}$, 1 to 7
1 to 2, $\frac{1}{4}$	1:3, 1 to 5	1:4, 1 to 6	$\frac{2}{10}$, 1:7	$\frac{1}{6}$, 7 to 56
3:6, 2:10	$\frac{1}{3}$, $\frac{2}{12}$	1 to 4, 1:7	$\frac{20}{100}$, 1 to 8	1 to 6, 1:9
1 to 2, 5:30	1:3, 2 to 14	2 to 8, $\frac{3}{24}$	$\frac{1}{5}$, $\frac{1}{9}$	1:6, 1 to 10
$\frac{1}{2}$, $\frac{4}{28}$	4 to 12, 1:8	$\frac{6}{54}$, 2:8	1:5, 1 to 10	
5:10, $\frac{1}{8}$	$\frac{1}{3}$, 1 to 9	1:4, $\frac{10}{100}$		
1:2, 1:9	1 to 3, $\frac{10}{100}$			
1:10, $\frac{50}{100}$				
<u>1:7</u>	<u>1:8</u>	<u>1:9</u>	<u>1:10</u>	
$\frac{1}{7}$, 1:7	1:8, 1 to 8	1 to 9, 2:18	$\frac{5}{50}$, 10:100	
$\frac{4}{28}$, $\frac{1}{8}$	$\frac{1}{8}$, $\frac{1}{9}$	1:9, $\frac{1}{10}$		
1:7, 1 to 9	1 to 8, 5:10			
1:7, 1:10				

MONSTER RATIO

Recognizing
Equivalent
RATIO

For information on the construction
of ratio cards see next page.

You will need the
Monster Ratio cards
and 2 or more players.

Rules:

- The dealer deals out all of the cards, one at a time, to the players.
- All players lay down the matches in their hands. A match is two cards showing equivalent ratios. Some examples of matches are shown.

- When all matches have been laid down from the players' hands, the dealer draws a card from the hand of the player to the left and, using the card, tries to make a match. If no match can be made, the player keeps the card in his hand.
- The player to the left then draws a card from the next player, and so on.
- The player that finishes the game holding the Monster card is the loser.

TYPE: Game

MONSTER RATIO

(CONTINUED)

DIRECTIONS FOR MAKING RATIO RUMMY
AND MONSTER RATIO CARDS.

- a) The deck consists of 54 cards with an additional Monster card.
- b) There should be 6 cards for each ratio used, 3 cards using the 3 ratio notations, and 3 cards using equivalent ratios. For example,

1 to 2, 1:2, $\frac{1}{2}$, 4 to 8, $\frac{2}{4}$, 50:100.
- c) If possible, one of the equivalent ratios should be expressed with 100 as the second term as readiness for percent.
- d) The choice of ratios is left to the teacher with these suggestions. Perhaps two decks, Ratio 1 and Ratio 2, could be made with 1:2, 1:4, 3:4, 1:5, 4:5, 1:10, 3:10, 7:10, 9:10 (these all easily convert to hundredths) as the first deck, and 1:3, 2:3, 2:5, 3:5, 1:6, 1:8, 3:8, 5:8, 7:8 as the) second deck.
- e) The cards can be made from 3 x 5 note cards. By cutting the note cards into two 3 x $2\frac{1}{2}$ cards you will have convenient sized cards. Blank cards with rounded corners may be purchased at the rate of \$3.30 per 500 cards. These cards must be ordered on an order form that can be obtained from:

Personalized Instruction Center
NCEBOCS
830 South Lincoln
Longmont, Colorado 80501

Ratio Rummy

For information on construction of cards see *Monster Ratio*.

Recognizing
Equivalent
RATIO

- 2-5 players are needed.
- Each player is dealt 7 cards.
- The remaining cards are placed face down to form a stack with the top card turned up to form the discard pile.
- The player to the left of the dealer draws the top card, either from the stack or the discard pile. A player must discard each turn.
- Each player tries to lay his cards on the table by:

- Making a Type I book of 4 simplified ratios having the same ratio notation.

Type I

- Making a Type II book of 3 or more cards that show equivalent ratios.

Type II

- Playing a card on a Type II book already played by someone else. $1:4$ or $\frac{3}{12}$ could be played on the above book.

f) Scoring

- Score 5 points for the first person to lay down all his cards.
- Score 1 point for each card laid down.
- Subtract 1 point for each card not laid down.
- First player to get 30 points wins the game.

RATIO

ε
S
I

Average Life Span (in years)

Buffalo - 20

Gorilla - 25

Rabbit - 5

Elephant - 50

Cat - 15

Chimpanzee - 30

Write a ratio comparing the average life spans of these animals. Then simplify each ratio.

- Buffalo to Rabbit ____:____ = ____:____
- Gorilla to Elephant ____:____ = ____:____
- Chimpanzee to Cat ____:____ = ____:____
- Rabbit to Buffalo ____:____ = ____:____
- Chimpanzee to Elephant ____:____ = ____:____
- The ratio of the average life span of the Buffalo to Man is 1:3. About how many years can Man expect to live? _____
- The ratio of the average life span of a Gorilla to a Gerbil is 5:1. About how long can a Gerbil be expected to live? _____
- The ratio of the average life span of a Buffalo to a Guinea Pig is 5:1. About how long can a Guinea Pig be expected to live? _____
- The ratio of the average life span of a Cat to a Dog is 1:1. What is the expected life span of a Dog? _____
- The ratio of the average life spans of a Bat, a Cat, and a Grizzly Bear is 1:3:6. About how long is the average life span of a Bat and a Grizzly Bear? _____

RATIOS IN YOUR SCHOOL

50% of the
Equivalent
RATIO

E
S
I

Fill in this chart. Guess first then get the actual numbers from your teacher.

PEOPLE IN YOUR SCHOOL	GUESSES			ACTUAL NUMBER		
	NUMBER OF FEMALES	NUMBER OF MALES	TOTAL	NUMBER OF FEMALES	NUMBER OF MALES	TOTAL
COUNSELORS						
SCHOOL NURSES						
YOUR CLASS						
ALL STUDENTS						
TEACHERS						
PRINCIPALS						
COOKS						
CUSTODIANS						
SECRETARIES						
TOTALS						

- I. Use the chart of actual numbers to find these ratios. If possible write each ratio in simplest form.

This activity could extend over parts of two days by having the students make the guesses on one day and use the actual numbers to find the ratios on the next day. Pairs of students could be assigned to talk to the various groups to get the actual numbers.

The ratio of:

- Males to females in your class is ___ to ___ or ___:___.
- Students in your class to all students is ___ to ___ or ___:___.
- Principals to all students is ___ to ___ or ___:___.
- Cooks to everyone in school is ___ to ___ or ___:___.
- Female teachers to male teachers is ___ to ___ or ___:___.
- Female teachers to total teachers is ___ to ___ or ___:___.
- Male cooks to female cooks is ___ to ___ or ___:___.
- Male principals to female principals is ___ to ___ or ___:___.
- Female secretaries to male secretaries is ___ to ___ or ___:___.
- All teachers to all students is ___ to ___ or ___:___.

Pupil-Teacher Ratio is the closest whole number of students for each teacher. For example, in a school with 224 students and 10 teachers the pupil-teacher ratio is 224 to 10 or about 22 to 1.

- Find the pupil-teacher ratio for your school. ___:___
- Find the pupil-counselor ratio for your school. ___:___

ONE MAN ONE VOTE

RATIOS

From a world almanac find

- the number of senators in Congress _____
- the number of representatives in Congress _____
- the ratio of senators to representatives is _____:_____ or about _____:_____.

How many senators does your state have in Congress? _____

How many representatives does your state have in Congress? _____

Write the ratio of senators to representatives in your state _____:_____.

Are the two ratios equivalent?

In the 94th Congress the House of Representatives has _____ Democrats and _____ Republicans. The ratio of Democrats to Republicans is about _____:_____

What is the ratio of Democrats to Republicans in the House of Representatives in your state? _____:_____

There are 16 women in the 94th Congress. All serve in the House of Representatives. The ratio of women to men is _____:_____, or about 1 woman for every _____ men.

The number of representatives each state has is based on the population of the state. Oregon has 4 representatives out of 435 or about 1:100. If the population of the United States is about 200,000,000 people, approximate the population of Oregon. _____

Check in the almanac to see how close your approximation is.

Use 2,000,000 people as the population of Oregon and approximate the population of these states.

State	Number of Representatives	Approximate Population	Actual Population
Tennessee	_____	_____	_____
Maine	_____	_____	_____
Massachusetts	_____	_____	_____
Nevada	_____	_____	_____
California	_____	_____	_____

On a map of the United States color the states according to the number of representatives.

1 - 5 Red
6 - 10 Orange
11 - 15 Yellow
16 - 20 Green

21 - 25 Blue
26 - 30 Purple
31 - 35 Violet
36 - more Black

Can you see an area of the United States that has a large population? a small population?

Poppin' Wheelies In A Ring

Simplifying
Equivalent
RATIO

If students have not used a spirograph before, let them spend some time making patterns with it.

Use spirograph rings and wheels for your experiment.

Look at the patterns below. Can you decide which rings and wheels have been used to draw each of them? If you think you know, try drawing them to see whether or not you are right.

Look at the numbers on the ring and wheel for each pattern. Do these help you decide what patterns you can get?

Examine the two rings in the set. Both have many numbers on them. One ring has 96 and 144. This means there are 96 teeth on the inside of the ring and 144 on the outside. Look at one of the wheels. The largest number tells you how many teeth it has.

1) Use the 96 ring and the 32 wheel. Draw a pattern with it.

2) How many loops are there on the shape?

3) How many times must the wheel go around the inside of the ring before the pattern begins to repeat?

TYPE: Activity/Manipulative

Book 2

PEOPLE RATIO

TEACHER DIRECTED ACTIVITY

Simplifying
Equivalent
RATIO

Population density is the average number of people for each square mile of land considered. It is computed by comparing the total population to the total land area. To make this ratio meaningful to students modified population densities can be investigated.

- I. Gather data from the students informally during class discussion.
 - a) Find the average number of people per household for the class. Example: There are 28 students in the class, each from a different household. Each student reports the number of people living at home. These numbers are added to obtain the total population, say 105. The ratio 105:28 is about equivalent to 4:1 or 4 people per 1 household.
 - b) Find the average number of pets per household for the class.
 - c) Find the average number of dogs (cats) per household for the class.
- II. Use local census data and an almanac.
 - a) Have students find the population density of their city (county). (Population figures can be obtained from census data which is usually filed in city libraries.) Has the population density increased or decreased in the last fifty years? What are some of the changes that occur in the community when the population increases (decreases)? How are jobs, transportation systems and housing affected?
 - b) Have students find the population density of their state. Compare this density to the population density of the city or county. Compare the densities of nearby states. What conclusions can one make?
 - c) Ask if there are students who have visited or lived in foreign countries. Have students make a chart of these countries which includes the population, area and population density for each country.

Country	Population (1970)	Area (sq. miles)	Population Density
U.S.	203,235,298	3,536	$\frac{203}{4} \div \frac{51 \text{ people}}{1 \text{ sq. mile}}$
Canada			
Mexico			
.			
.			
.			

Compare and discuss the population density of the different countries. What problems result from high population density?

- III. Have students use the almanac to find the birth rate for the foreign countries listed in II. (c).

Does the birth rate have any relationship to the population density? What effects does the "population explosion" have on population density? Why do some countries have higher birth rates than others?

Discuss the "population explosion" problem. Predict the population of various countries by the year 2000. How will the predictions affect the population density?

Students need skills in rounding large numbers and simplifying ratios. Calculators could be used for exact answers or to check approximations.

TYPE: Paper & Pencil/Class Discussion/Activity

SURFACE AREA & RATIOS 1

Simplifying
Equivalent
RATIO

Materials needed: A set of 125 centimetre cubes

Activity:

- ①
- Use 1 cube. Call it the unit cube.
 - How many faces on the cube?
 - Each edge is 1 cm, so each face is 1 cm by 1 cm or 1 cm^2 .
 - The unit cube has a surface area of $\_\_\_ \times 1 \text{ cm}^2$ or $\_\_\_ \text{ cm}^2$.

- ②
- Build a model of a larger cube, so all edges are 2 cm. You should have used 8 cubes.
 - What is the area of each face? $\_\_\_\_\_\_$ or $\_\_\_\_\_\_$
 - What is the area of this cube? $6 \times \_\_\_\_\_\_$ or $\_\_\_\_\_\_$

- ③
- Continue to make larger cubes with edges of 3 cm, 4 cm, 5 cm . . . until you run out of cubes. Find the surface area of each cube and record it in this chart. See if you can finish the chart up to a cube that has an edge of 10 cm.

EDGE OF CUBE (CM)	TOTAL CUBES USED	AREA OF 1 FACE (CM ²)	SURFACE AREA OF CUBE (CM ²)	RATIO OF SURFACE AREAS OF LARGE CUBE TO SMALL CUBE	SIMPLIFIED RATIO
1	1	1	6	6 : 6	1 : 1
2	8	4	24	24 : 6	4 : 1
3	27				
4	64				
5					
6					
7					
8					
9					
10					

- ④
- Predict the ratio of the surface area of a large cube to the surface area of the unit cube if the large cube has an edge of:

- 20 cm $\_\_\_\_\_\_ : \_\_\_\_\_\_$
- 12 cm $\_\_\_\_\_\_ : \_\_\_\_\_\_$
- 1.5 cm $\_\_\_\_\_\_ : \_\_\_\_\_\_$
- n cm $\_\_\_\_\_\_ : \_\_\_\_\_\_$

TYPE: Activity

Mathematics, Book 5

SURFACE AREA & RATIOS 2

Simplifying
Equivalent
RATIO

The student should have worked *Surface Area & Ratios 1* before this page and should have the information from that page available.

Materials: A set of centimetre cubes (at least 200)

Activity:

MODEL 1

- ①
 - a) Make a $3 \times 2 \times 1$ model from the cubes.
 - b) Each face of each cube has a surface area area of 1 cm^2
 - c) The model has 6 faces. What is the surface area of the top? cm^2 , bottom? cm^2 , front? cm^2 , back? cm^2 , left? cm^2 , right? cm^2 , —
 - d) The surface area of the entire model is cm^2 .
- ②
 - a) Enlarge Model 1, so it is twice as long, twice as wide and twice as high.
 - b) Model 2 is now $\text{cm} \times \text{cm} \times \text{cm}$
 - c) In Model 2 what is the surface area of the top? cm^2 , bottom? cm^2 , front? cm^2 , back? cm^2 , left? cm^2 , right? cm^2
 - d) The surface area of Model 2 is cm^2 .
 - e) The ratio of the surface areas of model 2 to model 1 is cm^2 : cm^2 or cm^2 : cm^2
- ③
 - a) Enlarge Model 1, so it is three times as long, three times as wide, and three times as high.
 - b) Model 3 is now $\text{cm} \times \text{cm} \times \text{cm}$
 - c) The surface area of Model 3 is cm^2 .
 - d) The ratio of the surface areas of Model 3 and Model 1 is cm^2 : cm^2 or cm^2 : cm^2
- ④ Use the results of *Surface Area & Ratio 1* to complete this chart for models that have dimensions 4 times the dimensions of Model 1; 5 times; 6 times.

MODEL	SIZE	SURFACE AREA(cm^2)	RATIO OF THE SURFACE AREA OF THIS MODEL TO THE SURFACE AREA OF MODEL 1
1	$3 \times 2 \times 1$		
2	$6 \times 4 \times 2$		$88 : 22 = 4 : 1$
3	$9 \times 6 \times 3$		$: 22 = : 1$
4			$: 22 = 16 :$
5			$: = :$
6			$: = :$

- ⑤ Can you predict the ratio of the surface area of a model with dimensions that are 10 times the dimensions of Model 1? cm^2 : cm^2
that are n times the dimensions of Model 1? cm^2 : cm^2

TYPE: Activity
IDEA FROM: New Oxford Junior
Mathematics, Book 5

VOLUME AND RATIO 1

Simplifying
Equivalent
RATIO

Materials needed: A set of centimetre cubes.

- ① Use a centimetre cube as the unit cube. The volume of this unit cube is $1 \text{ cm} \times 1 \text{ cm} \times 1 \text{ cm} = 1 \text{ cm}^3$.

- ② Make 3 different models:

- a) one twice as long as the unit cube.
b) one twice as long and twice as wide as the unit cube.

- c) one twice as long, twice as wide and twice as high as the unit cube.

MODEL	DIMENSIONS	VOLUME (cm ³)	RATIO OF THE VOLUME OF THIS MODEL TO THE VOLUME OF THE UNIT CUBE
A	2 x 1 x 1		
B	2 x 2 x 1		
C	2 x 2 x 2		

- ③ Make 3 different models:

- d) one three times as long as the unit cube.
e) one three times as long and three times as wide as the unit cube.
f) one three times as long, three times as wide and three times as high as the unit cube.

MODEL	DIMENSIONS	VOL (cm ³)	RATIO OF THE VOLUME OF THIS MODEL TO THE VOLUME OF THE UNIT CUBE
D			
E			
F			

- ④ Make 3 different models:

- g) one four times as long as the unit cube.
h) one four times as long and four times as wide as the unit cube.
i) one four times as long, four times as wide and four times as high as the unit cube.

MODEL	DIMENSIONS	VOL (cm ³)	RATIO OF THE VOLUME OF THIS MODEL TO THE VOLUME OF THE UNIT CUBE
G			
H			
I			

- ⑤ The Jones have a swimming pool that is 2 metres deep, 4 metres wide and 7 metres long. Mr. Smith, who lives next door, wants to build a larger pool. How many times as much water will Mr. Smith need if he builds a pool twice as long and twice as wide?

TYPE: Activity

IDEA FROM: New Oxford Junior
Mathematics, Book 5

Many other questions can be asked about number 5.

Volume and Ratio 2

Simplifying
Equivalent
RATIO

The student should have worked *Volume and Ratio 1* and should have the information from that page available.

Materials needed: A set of centimetre cubes

Activity:

- (1) a) Use the cubes and make this model.
b) The volume (in cm^3) of this model is _____.
- (2) Make 3 models:
 - a) One twice as long as Model 1.
 - b) One twice as long and twice as wide as Model 1.
 - c) One twice as long, twice as wide, and twice as high as Model 1.

MODEL 1

Model	Dimensions	Volume (cm^3)	Ratio of the volumes of this model to Model 1	Simplified ratio
a	$6 \times 2 \times 1$	12 cm^3	: 6	: 1
b			:	:
c			:	:

- (3) Make 3 more models:
 - d) One three times as long as Model 1.
 - e) One three times as long and three times as wide as Model 1.
 - f) One three times as long, three times as wide, and three times as high as Model 1.

Model	Dimensions	Volume (cm^3)	Ratio of the volumes of this model to Model 1	Simplified ratio
d	$9 \times 2 \times 1$	18 cm^3	: 6	: 1
e			:	:
f			:	:

- (4) Compare the simplified ratios with the simplified ratios in *Volume and Ratio 1*.
- (5) If the simplified ratio of the volumes of a model to Model 1 is 16:1, how many of the dimensions are four times larger than Model 1?

TYPE: Activity

IDEA FROM: New Oxford Junior
Mathematics, Book 5

Materials needed: Construction paper, scissors and paste, glue, or tape.

Activity: (1) Copy this pattern on the construction paper. Cut it out and fold it on the dotted lines to make a cube with each edge 2 cm long.

- (2) Use a similar pattern and make 3 cubes with edges of 1 cm, 4 cm and 8 cm.
- (3) Make a table like this and write the simplified ratios of lengths of the edges, areas of the faces and volumes of the cubes.

	1 cm to 2 cm	2 cm to 4 cm	4 cm to 8 cm
Length of edges	1 : 2		
Area of faces	1 : 4		
Volume of cubes			

- (4) Make cubes and a chart to show the simplified ratios of 3 cubes with edges of 1 cm, 3 cm, 27 cm.
- (5) Compare the 1 cm cube to the 4 cm cube;
1 cm cube to the 8 cm cube;
2 cm cube to the 8 cm cube.

Do you see any patterns?

TYPE: Activity

IDEA FROM: New Oxford Junior
Mathematics, Book 2

This activity could be done with centimetre cubes.

Ratio as a Real Number
RATIO

All squares are the same shape
All squares are similar

Materials needed: Metric ruler and centimetre (or $\frac{1}{2}$ cm) grid paper.

- Activity:
- (1) On the centimetre grid paper draw a square 4 cm on a side. Measure the diagonal of the square. Did you get about 5.6 cm?
 - (2) Draw a square 7 cm on a side. Measure the diagonal. Is it about 9.8 cm?
 - (3) Draw squares with the sides shown in the table, and measure the diagonals.

Record the results on your paper.

Side (cm)	Diagonal (cm)	Ratio of diagonal to side	Simplified ratio
1			: 1
2			: 1
3			: 1
4	5.6	5.6:4	1.4 : 1
5			: 1
6			: 1
7	9.8	9.8:7	: 1
8			: 1

Divide both terms
by the length
of the side.

Similar activities can be developed around ratios of sides to diagonals of similar rectangles, or ratios of sides of similar triangles.

- (4) For each square write the ratio of the length of the diagonal to the length of the side. Then simplify each of the ratios by dividing the length of the diagonal by the length of the side.
- (5) The simplified ratio is always about __:1. This means the diagonal of a square is about __ times the length of a side.
- (6) Use the above fact to find the length of the diagonal of a square if the side measures
 - (a) 1.5 cm _____
 - (b) 1.8 cm _____
 - (c) 2.5 cm _____
 - (d) 3.8 cm _____
 - (e) 5.7 cm _____
 - (f) 6.5 cm _____

Check these by drawing the squares and measuring the diagonals.

Challenge: What is the length of a side of a square if the diagonal is:

- (a) 1.4 cm? _____
- (b) 4.2 cm? _____
- (c) 7 cm? _____

A Very Special Ratio

Approximating π
Ratio as a Real Number
RATIO

DIAGRAM A

Materials: Metre stick, cans of varying diameters, rolls of tape, small wheels, string or paper to wrap around objects

You may wish to use cardboard discs cut with diameters of 2 cm, 4 cm, 7 cm, 8 cm and 10 cm.

DIAGRAM B

Procedure:

1. Place the metre stick on a level surface.
2. Measure the diameter of a can by placing it on the metre stick. Record on the chart. (See Diagram A.)
3. Wrap string or paper around the can one time and measure the length of the string or paper.
4. Record the measurement in the chart.
5. Carefully roll a can along the metre stick for one complete turn to check for accuracy in step 3. (See Diagram B.)
6. Complete the chart. Use a calculator to find the values correct to two decimal places.

DIAMETER OF CAN	LENGTH OF STRING	LENGTH + DIAMETER	LENGTH - DIAMETER	LENGTH $\times$ DIAMETER	LENGTH $\div$ DIAMETER

In which column are the numbers nearly the same? _____

If you were careful in carrying out your experiments, you found that the circumference (length of the string) divided by the diameter of the can is about 3.1 or 3.2. This can be expressed as the ratio, circumference : diameter = 3.1:1, which is approximately 3:1.

To represent this ratio we use the Greek letter π (pi). π is pronounced "pie."

π cannot be exactly expressed as a decimal, no matter how many decimal places are used.

π is approximately

3.14159265358979323846264338327950288409716939937510

PI'S THE LIMIT

DIAGRAM III

- I. Draw a circle with a radius of at least 6 cm. Mark between 8 and 15 points on the circle any distance apart. They need not be equally spaced. Label the points with lower case letters. (See Diagram I.)

- II. Connect consecutive points with line segments. Measure each segment and record the length in millimetres next to the segment. Add the measures and record the total in the top part of the table below. (See Diagram II.)

Record the diameter of the circle in millimetres.

- III. Outside the circle draw line segments that touch the circle only at the points you have already marked (a, b, c, etc.). Label with capital letters the points where the line segments cross. You should have the same number of capital letters as lower case letters. Measure each new line segment and record its length as before. Add these measures and record in the table below. (See Diagram III.)

- IV. Record the diameter of the circle in millimetres. _____

Total of measures of segments inside of the circle	
Total of measures of segments outside of the circle	

Average of totals _____

- V. Compute: $\frac{\text{Average of totals}}{\text{Diameter of circle}} = \underline{\hspace{2cm}}$

Hint: To compute the average, add the two totals and divide by 2.

Repeat the experiment with a larger circle.

PI'S THE LIMIT (CONTINUED)

TEACHER PAGE

Purpose and Use:

This activity provides the student with an alternative and historical method for approximating π . In addition, the activity could be used as an exercise for measurement with a ruler. A calculator would facilitate the computation.

Suggested Procedure:

After the activity, introduce the term circumference as the distance around the circle. Some sample discussion questions could be:

- 1) Do you understand why the circumference is smaller than the total of outside measures and larger than the total of inside measures of segments?
- 2) Is the average of totals a good approximation to the circumference?
- 3) How does the number of points on the circle affect the accuracy?

Content:

The ratio $\frac{\text{average of totals}}{\text{diameter of circle}}$ closely approximates the ratio $\frac{\text{circumference of a circle}}{\text{diameter of the circle}}$, which is about 3:1. The Greek letter π is used to express the ratio $\frac{\text{circumference}}{\text{diameter}}$, since the ratio is a constant and cannot be exactly expressed as a fraction or decimal.

Historical Facts & Curiosities:

- 1) Archimedes (287-212 B.C.), a great mathematician and scientist of ancient Greece, used a method similar to the one performed by the students to estimate that π was between 3.140845 and 3.142857.
- 2) In China Tsu Chung-Chih (470 A.D.) gave $\pi = 3.1415924$ which is correct to seven decimal places.
- 3) Today with the help of computers π has been found to more than 500,000 places. π correct to twenty places is 3.14159265358979323846.
- 4) The symbol π was first used in the 17th century.
- 5) In 1873 using a formula and making the computations with paper and pencil William Shanks of England computed pi to 707 decimal places. His representation of pi was used until 1948 when two men, using a computer, discovered that Shanks had made an error in the 528th decimal place.

3. 14159265

- 6) Another method is to set π to music. The music shown above represents π in the key of C, with F having a value of 3, D the value of 1, and so on.

An excellent source for information about π is A History of π by Petr Beckmann published by the Golem Press.

BUFFON'S PI

Approximating π
Ratio as a Real Number
RATIO

1 METRE SQUARE CLOTH

Equipment:

10 toothpicks

1 metre square cloth

Mark the cloth with parallel lines. The distance between the lines should be twice the length of a toothpick. The cloth will keep the toothpicks from rolling.

Comte de Buffon, a 16th century Frenchman, is known for this "Buffon needle problem" in the theory of probability.

T

R

2-4 people

Total number of picks dropped
Total number of picks touching

Have students work in pairs or small groups so that some can drop toothpicks and others can tally. Calculators will speed up the computation and motivate students to consider a large number of tosses. Each trial takes about 2 minutes.

A										100		
B										200		
C										300		
D										400		
E										500		
F										600		
G										700		
H										800		
I										900		
J										1000		

Place the cloth on a flat surface. Select a person to record the data and one to drop the picks. You may wish to exchange positions.

- I. Hold the 10 toothpicks a metre above the cloth and carefully drop them. Repeat this ten times. Each time record in Chart A the number of toothpicks touching or crossing a line. Total the number of picks touching and record in Column T. Divide 100 by this total. Round to two decimal places and record in Column R.
- II. Repeat the experiment. Record in Chart B. Total the number of picks touching and add this to the previous total of toothpicks touching. (See Column T.) Record the new total in Column T. Divide 200 by this total and record in Column R.
- III. The ratio Total toothpicks dropped : Total toothpicks touching a line should approximate π whose value is about 3.14. Continue the experiment and check the ratio after each trial. In 1901 Lazzerini, an Italian, found π correct to 6 decimal places or 3.141592 from 3408 drops.

CLOSER & CLOSER

Ratio as a Real Number
RATIO

Investigation I:

- A) Make a sequence of counting numbers by selecting two numbers and writing them in the first two blanks below. Each number after the first two is obtained by adding the two previous numbers.

Example: $\underline{5}$, $\underline{7}$, $\underline{12}$, $\underline{19}$, ...
(5+7), (7+12)

Choose your own numbers.

____, _____, _____, _____, _____, _____, _____, _____,

____, _____, _____, _____, _____, _____, _____, ...

- B) Now use the sequence above to write a sequence of ratios. The ratios are obtained by comparing each number to the number on the right.

If you used: $\underline{5}$, $\underline{7}$, $\underline{12}$, $\underline{19}$, ...

The ratios are (1) $\frac{5}{7}$, (2) $\frac{7}{12}$, (3) $\frac{12}{19}$, ...

(1)____, (2)____, (3)____, (4)____, (5)____, (6)____, (7)____, (8)____,

(9)____, (10)____, (11)____, (12)____, (13)____, (14)____

- C) Use your calculator to change each ratio to a decimal.

1. _____	8. _____
2. _____	9. _____
3. _____	10. _____
4. _____	11. _____
5. _____	12. _____
6. _____	13. _____
7. _____	14. _____

- D) What do you notice about the sequence of ratios?
E) If each decimal is rounded to three places, the ratios get close to what number? (.618)
F) Pick two different numbers and repeat the steps. What do you notice about this sequence of ratios?
G) Suppose your friend picks any two counting numbers and repeats the steps to get a sequence of ratios. If these ratios are written as three place decimals, what number do they get close to?

TYPE: Paper & Pencil

The ratios get close to the
Golden Ratio which equals
 $\frac{\sqrt{5}-1}{2} \approx .618.$

CLOSER & CLOSER

Investigation II: (CONTINUED)

- A) Make a sequence of counting numbers by selecting three numbers and writing them in the first three blanks below. Each number after the first three is obtained by adding the three previous numbers.

Example: 5, 7, 2, 14, 23
(5+7+2) (7+2+14)

Choose your own numbers.

____, _____, _____, _____, _____, _____, _____, _____,
____, _____, _____, _____, _____, _____, _____, _____

- B) As in Investigation I, write a sequence of ratios by comparing each number to the number on the right.

If you used: 5, 7, 2, 14, ...

The ratios are: (1) $\frac{5}{7}$, (2) $\frac{7}{2}$, (3) $\frac{2}{14}$

(1) _____, (2) _____, (3) _____, (4) _____, (5) _____, (6) _____, (7) _____, (8) _____,
(9) _____, (10) _____, (11) _____, (12) _____, (13) _____, (14) _____

- C) Use your calculator to change each ratio to a decimal.

1. _____	8. _____
2. _____	9. _____
3. _____	10. _____
4. _____	11. _____
5. _____	12. _____
6. _____	13. _____
7. _____	14. _____

- D) What do you notice about the sequence of ratios?
E) If each decimal is rounded to three places, the ratios get close to what number? .544
F) Pick three different numbers and repeat the steps. What number do these ratios get close to?

- Extension: 1) Have students make a sequence by selecting four counting numbers. Each number after the first four is obtained by adding the four previous numbers. Again, write the sequence of ratios and use a calculator to change each ratio to a decimal. These ratios get close to .519
- 2) Repeat for different original sequences--pick five initial numbers and obtain additional numbers by adding the previous five, or pick six initial numbers and add six numbers to get the next number, etc. In each case record the number that the ratios get close to.
- 3) If n counting numbers are picked initially, and each number after these is formed by adding the n previous numbers, the sequence of ratios get close to .5.

RABBITS, PLANTS AND RECTANGLES

ACTIVITY I

Determining the
Fibonacci Numbers
Ratio as a Real Number
RATIO

A man bought a pair of rabbits in January. The pair produced one pair of young rabbits after one month, a second pair after the second month and then stopped. Each new pair also produced two more pairs in the same way and then stopped. How many pairs of rabbits were born each month?

A picture could be used to organize the results. Extend the picture. Examine the "new pairs" column and see if you can discover a pattern to help predict the number of new pairs of rabbits each month.

In June, for example, only the April and May rabbits can produce. Thus, the number of new pairs in June is found by adding the pairs of rabbits from April and May.

MONTH	PAIRS OF RABBITS	NEW PAIRS
JANUARY		1
FEBRUARY		1
MARCH		2
APRIL		3
MAY		5
JUNE		
JULY		
AUGUST		
SEPTEMBER		
OCTOBER		
NOVEMBER		
DECEMBER		

The numbers we get from the "new pairs" column

1, 1, 2, 3, 5, —, —, —, —

are called Fibonacci numbers.

RABBITS, PLANTS AND RECTANGLES

ACTIVITY II

Discovering Ratios in
Nature
Ratio as a Real Number
RATIO

E
S
I

The Fibonacci numbers: 1,1,2,3,5,8, . . . have many interesting properties and appear in many places in nature.

What do you notice about the number of petals in these flowers?

Check the flowers in your own garden. Count the petals. Are any of the numbers Fibonacci numbers? Students may bring in real flowers to inspect.

When new leaves or twigs grow from the stem of a plant, they spiral around the stem. Select one leaf as a starting point and count up the stem leaf by leaf until you reach a leaf that is directly above the starting point. Record the number of leaves and the number of turns taken around the stem in counting the leaves. What do you notice about these numbers?

Ratio:

$$\frac{\text{number of turns}}{\text{number of leaves}} = \frac{1}{2}$$

Ratio: _____

Ratio: _____

The result is often stated as a ratio: $\frac{\text{number of turns}}{\text{number of leaves}}$.

The beech tree has a ratio of $\frac{1}{3}$, the pussy willow is $\frac{5}{13}$.

Examine the pictures above and write the ratio for each tree.

The number of leaves and the number of turns are usually Fibonacci numbers.

Check a cornstalk. What is its ratio?

Fibonacci numbers also occur in nature in the number of spirals in the seed patterns of sunflowers and scale patterns in pine cones and pine-apples. Check the photograph and diagram of a pine cone. A photograph of the head of a daisy and accompanying diagram of the spirals is shown in *Mathematics, Life Science Library*, page 93.

RABBITS, PLANTS AND RECTANGLES

ACTIVITY III

Approximating the Golden
Ratio
Ratio as a Real Number
RATIO

E
S
I

Agnes, Betty, Carol, and Diane are competing in a beauty contest. You are the judge. Who has the best shape? _____ . Use a ruler to find each girl's measurements in millimetres. Complete the table.

The Golden
Ratio equals

$$\frac{\sqrt{5}-1}{2} \approx .618.$$

Contestant	Width	Length (height)	Ratio of width to length	
AGNES			:	:1
BETTY			:	:1
CAROL			:	:1
DIANE			:	:1

Divide the width by the length and express as a three-place decimal.

Is the ratio of Diane's width to height about .618:1?

The ratio .618:1 is called the Golden Ratio. In a rectangle if the ratio of the width to the height is the Golden Ratio the rectangle is a Golden Rectangle. Many examples of the Golden Rectangle can be found in both art and architecture--the United Nations building, the Parthenon at Athens. Find pictures of these buildings and check to see if they are Golden Rectangles. Can you find examples of Golden Rectangles in the classroom?

TYPE: Paper & Pencil

ACTIVITY IV

Constructing a Golden
Rectangle
Ratio as a Real Number
RATIO

Can you make a Golden Rectangle?

First, draw
a 4 cm square.

Next, locate point E,
the midpoint of segment
AB. Join C to E.

Extend side AB
and mark point
F so that EF is
the same length
as segment CE.

Complete the
rectangle.

Once a Golden Rectangle has been
drawn, both larger and smaller
Golden Rectangles can be generated.

To check your drawing, find the ratio:

$\frac{\text{length AD}}{\text{length AF}}$ and express it as a three-place
decimal.

Write the ratio: $\frac{\text{length BF}}{\text{length CB}}$ and express it
as a three-place decimal. What can you
say about rectangle CBFM?

In rectangle ABCD
make square DARS.
Rectangle RCBS is
a Golden Rectangle.
Now make square SBPQ.
RCPQ is a Golden
Rectangle. To make
a larger Golden
Rectangle first
make square ABXY.
DCXY is a Golden
Rectangle.

WHAT'S IN A CIRCLE ?

The circle to the left has five equally
spaced points marked on it.

Join points A and D, D and B, B and E,
E and C, C and A. You have just drawn
a five-pointed star.

Locate the point where line segments
EC and AD cross and label it T.

Measure the segments TD and AT. Find
the ratio $\frac{TD}{AD}$ = — and express it as a
three-place decimal. What do you
notice? Do you see a way to draw a
smaller five-pointed star?

The following ratios are all Golden
Ratios.

$$\frac{AT}{AD}, \frac{AP}{AT}, \frac{PT}{AP}$$

IDEA FROM: Mathematics in Art

RABBITS, PLANTS AND RECTANGLES

ACTIVITY V

(PAGE 2)

TEACHER PAGES

Pythagoras (569-500 B.C.) and his followers observed many patterns in nature and used mathematics to help interpret them. They were especially interested in the pentagon.

It was discovered that when two diagonals of a regular pentagon intersect, each is divided in the golden ratio.

That is, P divides $\overline{AD}$ so that $\frac{AP}{PD} = \frac{PD}{AD}$.

P is called the "golden cut" or golden section of $\overline{AD}$.

The problem of finding the golden section of any line segment was solved by Euclid.

Given the line segment PQ, he found a method for

locating a point R so that $\frac{RQ}{PR} = \frac{PR}{PQ}$.

To find the golden cut of line segment AB:

- 1) Mark the midpoint M of segment $\overline{AB}$
- 2) Draw a line perpendicular to $\overline{AB}$ at B
- 3) On the line mark the point T so that $BT = MB$
- 4) Join T to A
- 5) On segment $\overline{AT}$ mark the point R so that $RT = TB$
- 6) Measure the segment $\overline{AR}$ and mark the point C so that $AC = AR$. C is the golden cut, and both $\frac{CB}{AC}$ and $\frac{AC}{AB}$ are the golden ratio.

To find the numerical value of the golden ratio, use some algebra. Let the length of segment AB be 1 to simplify computation. C is the golden cut. Let $AC = x$, so $CB = 1 - x$.

RABBITS, PLANTS AND RECTANGLES

ACTIVITY V (PAGE 3)

Since C is the golden section,

$$\frac{CB}{AC} = \frac{AC}{AB} \quad \text{or} \quad \frac{1-x}{x} = \frac{x}{1}$$

By cross products

$$\begin{aligned} x^2 &= 1-x \\ x^2 + x - 1 &= 0 \end{aligned}$$

from the quadratic formula $x = \frac{-1 \pm \sqrt{5}}{2}$

Since x, the length of a segment, must be greater than zero, $x = \frac{-1 + \sqrt{5}}{2} = \frac{\sqrt{5} - 1}{2}$

The golden ratio = $\frac{\sqrt{5} - 1}{2} \approx .618$

By playing with the equation $x^2 + x - 1 = 0$, we can make some interesting discoveries. Dividing by x gives us $x + 1 - \frac{1}{x} = 0$, or $x + 1 = \frac{1}{x}$. The golden ratio is the only number that is increased by one by taking its reciprocal! Check this on a calculator. Be sure to use $\frac{\sqrt{5} - 1}{2}$ for the golden ratio and not the approximation .618.

Add 1 to the golden ratio and then square the result. What do you notice? Can you explain?

Let ϕ equal one more than the golden ratio.

Make a sequence starting with 1, ϕ . Each number after the first two is obtained by adding the previous two.

1, ϕ , $\phi + 1$, $2\phi + 1$, _____, _____, _____, ...

Use the calculator to obtain approximate values.

Create a geometric sequence by starting with 1, ϕ . Each number after the first two is obtained by multiplying the previous by ϕ .

1, ϕ , ϕ^2 , ϕ^3 , _____, _____, _____, _____, ...

Compare the two sequences. What do you notice? Can you explain?

Many more curiosities exist involving the golden ratio. Try your hand at discovering some. An excellent source is The Divine Proportion by H.E. Huntley.

PROPORTION

PROPORTION

In 1973 the ratio of juveniles to adults prosecuted for burglary was 11 to 9. This ratio can be represented by any of the pairs of numbers in the table below. These pairs of numbers are called equivalent or equal ratios.

<u>Juvenile Burglars</u>	<u>Adult Burglars</u>
11	9
22	18
33	27
44	36
.	.
.	.
.	.

"It says here, 'You have permanently lost your picture - the Midnite Phantom.'"

A proportion is a statement of equality between two ratios. Here are two ways of writing a proportion:

$$a:b = c:d \quad \text{or} \quad \frac{a}{b} = \frac{c}{d}$$

These proportions are both read as "the ratio of a to b is equal to the ratio of c to d." Sometimes the expression "a is to b as c is to d" is also used.

INTRODUCING YOUR CLASS TO PROPORTIONS

Two equal ratios contain 4 numbers. When 3 of these numbers are given, it is possible to determine the fourth number. For example, using the ratio of juvenile to adult burglars, 11 to 9, how many juvenile burglars would there be for every 90 adult burglars? Your students will be able to answer this question by extending the above table to the tenth row, which is the row containing the 90 adult burglars. Most students will understand this use of tables, and given any 3 numbers, they will be able to use multiples of a given ratio to find the fourth number of the proportion.

Proportions occur naturally when dealing with rates. Here's a familiar kind of question. If the cost of electricity is 3 cents for 2 kilowatt hours, how much will 8 kilowatt hours cost?

<u>Cost in Cents</u>	<u>Number of Kilowatt Hours</u>
3	2
6	4
9	6
.	.
.	.
.	.

Your students will find a variety of ways to answer such questions. Here are a few examples of sound reasoning which all produce the correct answer.

You may wish to have your students graph some rates. These graphs will always be straight lines if the rate stays constant. The following graph shows the rate of 3 cents for every 2 kilowatt hours. Some of your students will be able to use this graph to determine the cost of 5 kilowatt hours.

A TEST FOR EQUALITY

When a proportion is written in the form $a:b = c:d$, the first and fourth numbers are called the extremes, and the second and third numbers are called the means. Two ratios are equal whenever the product of the extremes is equal to the product of the means.

$$a : b = c : d \quad \text{whenever } ad = bc$$

$\begin{array}{c} \uparrow \quad \quad \uparrow \\ \text{MEANS} \\ \downarrow \quad \quad \downarrow \\ \text{EXTREMES} \end{array}$

When the proportion is expressed by fractions, we have:

$$\frac{a}{b} = \frac{c}{d} \quad \text{whenever } ad = bc$$

The products ad and bc are commonly called cross products. Students can remember this with the following aid.

$$\frac{a}{b} \times \frac{c}{d}$$

The test for equality of ratios is useful for finding the fourth number of a proportion when 3 of its numbers are known. Here is a typical rate problem which can be solved by using cross products. The Boeing 747 has a cruising speed of 595 miles per hour. How long will it take to travel 1500 miles at this rate?

It will be instructive for the students to try solving this problem with a list of numbers. The student will be able to see that the answer is between 2 and 3 hours. Some students will estimate that the answer is close to $2\frac{1}{2}$ hours.

Hours	Miles
1	595
2	1190
3	1785

Letting T be the unknown time, the given information can be expressed by the following equation. It must be emphasized to the student that the ratios are hours to miles on both sides of this equation.

$$\frac{1}{595} = \frac{T}{1500}$$

Using cross products, $(1) \times (1500) = 595T$, and so $T = 2.52$.

It is somewhat remarkable that proportions can be set up in so many different ways and still produce the correct answer. Look at the examples below. The same value of $T = 2.52$ satisfies each of the equations.

$\frac{1 \text{ hr.}}{595 \text{ mi.}} = \frac{T \text{ hr.}}{1500 \text{ mi.}}$	$\frac{595 \text{ mi.}}{1 \text{ hr.}} = \frac{1500 \text{ mi.}}{T \text{ hr.}}$	$\frac{595 \text{ mi.}}{1500 \text{ mi.}} = \frac{1 \text{ hr.}}{T \text{ hr.}}$	$\frac{1500 \text{ mi.}}{595 \text{ mi.}} = \frac{T \text{ hr.}}{1 \text{ hr.}}$
--	--	--	--

Could we use the expression $\frac{1 \text{ hr.}}{595 \text{ mi.}} = \frac{1500 \text{ mi.}}{T \text{ hr.}}$ to solve this problem? If we examine the cross products $1 \text{ hr.} \times T \text{ hr.}$ and $595 \text{ mi.} \times 1500 \text{ mi.}$, we see the unit of measure in the first product is $\text{hr.} \times \text{hr.}$ and in the second is $\text{mi.} \times \text{mi.}$. The units of measure of the cross products are not the same; we cannot use the expression above to solve the problem.

Often students try to apply proportions without noticing the units of measure given in the problem. Consider this problem: "A worm travels 12 cm every 4 seconds. How many metres does he travel in 48 seconds?" A student might set up the problem as $\frac{12}{4} = \frac{Y}{48}$, ignore the units and give 144 as the answer. If the units are included and their cross products checked, $\frac{12 \text{ cm}}{4 \text{ sec.}} = \frac{Y \text{ m}}{48 \text{ sec.}}$, it can be seen that $\text{cm} \times \text{sec.}$ is not the same as $\text{sec.} \times \text{m}$. The problem can be solved by changing 12 cm to metres or by finding an answer in centimetres and then converting it to metres.

$$\frac{.12 \text{ m}}{4 \text{ sec.}} = \frac{Y \text{ m}}{48 \text{ sec.}} \text{ or } \frac{12 \text{ cm}}{4 \text{ sec.}} = \frac{Y \text{ cm}}{48 \text{ sec.}}, \text{ where } \frac{Y}{100} = \text{the number of metres.}$$

Being conscious about the units of measure will not guarantee that the proportion is set up correctly. A student might try to solve the airplane problem discussed above with this proportion: $\frac{T \text{ hr.}}{1 \text{ hr.}} = \frac{595 \text{ mi.}}{1500 \text{ mi.}}$. The units of the cross products are the same, but this is certainly not a correct proportion. To avoid this confusion teachers often have students form proportions in a standard way, say miles to hours on both sides of the equation.

Suggested Exercises

Some interesting proportion problems can be solved by using cross products. If your students use the Guinness Book of World Records, they will find that frequently three of the four numbers of a proportion are given. For example, this book notes that in 1969 the country with the most physicians was the U.S.S.R. There were 555,400 physicians and a ratio of 1 physician to every 433 people. What was Russia's population in 1969? There are many such questions which can be generated from the rates which are in the book.

The numbers in the Guinness Book of World Records may be too large for some of your students. These proportion exercises from the student page *Petite Proportions 2* contain some common rate questions with smaller numbers.

- 9) 2 pantsuits for \$35.
7 pantsuits for _____.

- 11) Car goes 10 km on 2 litres of gas.
Car goes _____ km on 16 litres of gas.

There are many interesting proportion ideas and applications in the classroom materials. Here are a few examples: measuring heights of objects by using shadows; determining gear ratios on 10-speed bikes; using the Golden Ratio; placing weights on balance beams or teeter-totters; computing driver reaction times and braking distances for cars; using money exchange tables; and comparing your weight and height to standard growth charts.

INEQUALITIES OF RATIOS

There are times when it is useful to determine the greater of two ratios. The following ratios are from the 1973 Nielsen Ratings of Top Television Shows.

2 out of 5 households watched the Super Bowl.
1 out of 3 households watched the World Series.
7 out of 25 households watched the Riggs-King Tennis Match.

One way to compare two ratios is to write them in fraction notation and find the greater fraction. Since $\frac{2}{5}$ is greater than $\frac{1}{3}$, more households were tuned into the 1973 Super Bowl than the 1973 World Series. Another approach is to represent each ratio by a real number. Since $2 \div 5 = .4$ and $1 \div 3 \approx .33$, the Super Bowl had the greater audience. How did the T.V. audience for the Riggs-King Tennis Match compare with that for the World Series?

You may have noticed that in the above examples the ratios were used to compare part of a set to the whole set. The following examples, which are from the same 1973 Nielsen Ratings, use ratios to compare disjoint sets.

For every 8 men there were 5 women who watched the Super Bowl.
For every 5 men there were 4 women who watched the World Series.
For every 9 men there were 11 women who watched the Riggs-King Tennis Match.

Was there a greater ratio of men to women watching the Super Bowl or the World Series? To answer this question we may use the same approach as above. The ratio 8 to 5 is greater than the ratio 5 to 4 because $\frac{8}{5}$ is greater than $\frac{5}{4}$.

One of the most practical applications of inequalities of ratios is found in the current controversy over unit pricing. At this time there are no Federal laws requiring supermarkets to unit price their products. Here are some examples to illustrate the confusion which arises due to price calculations across packages of different sizes.

Which is the better buy, a or b?

- a. Complete Buttermilk Pancake Mix 40 oz. at 69¢
- b. Complete Buttermilk Pancake Mix 56 oz. at 85¢

- a. Variety Baking Mix 20 oz. at 31¢
- b. Buckwheat Mix 32 oz. at 55¢

Let's use our test for proportion to determine the cost per ounce of the 69¢ package of Complete Buttermilk Pancake Mix.

$$\frac{40 \text{ oz.}}{69 \text{ cents}} = \frac{1 \text{ oz.}}{y \text{ cents}}$$

By cross products, $40y = 69$, so $y = 1.7\text{¢}$. In a similar manner we can find that the cost per ounce of the 85¢ package is 1.5¢. The contents of the first package sells for 27¢ per pound, and the second package sells for 24¢ per pound. How does the price per pound of the Variety Baking Mix compare with the price per pound of the Buckwheat Mix?

There is an abundance of practice with proportions in computing unit prices. Your students could collect information (prices and weights) of different brands for unit pricing comparisons. Using a calculator will simplify the computations and allow students to focus on the proportions and comparisons.

For additional ideas in using proportions to compare rates see *Proportion Projects to Pursue* in the section PROPORTION: Application.

PROPORTION

$$\frac{2}{3} = \frac{4}{6}, 2:5 = 4:10$$

$$3:6 = 5:10$$

$$3 \text{ to } 5 = 6 \text{ to } 10$$

$$3:6 = 1:2$$

$$\frac{1}{3} = \frac{2}{6}$$

$$2 \text{ to } 3 = 4 \text{ to } 6$$

$$3 \text{ to } 6 = 5 \text{ to } 10$$

$$3:5 = 6:10$$

$$\frac{3}{6} = \frac{1}{2}$$

Use the four numbers 2, 6, 9, 27 to write a proportion. Then write the other forms.

Did you get the same proportion as your neighbor? Compare and see.

Can you make another proportion from the four numbers?

I LIKE YOUR FORM

Use line segments to connect the dots that name the same proportion.

The result is startling!

PROP OR SHUN

Generating Proportions
Getting Started
PROPORTION

TEACHER DIRECTED

In order to introduce or diagnose a student's concept of equivalent ratios, one could approach the subject intuitively. The presentation of various methods of checking for equivalent ratios can come later. Students need to be shown equivalent ratios in various forms such as 2:3 and 6:9, 1 to 5 and 4 to 20, or $\frac{3}{4}$ and $\frac{6}{8}$.

A first activity might be as follows: Several pairs of ratios can be written with open frames. The student fills in the frames with the appropriate value and determines if the ratios are equivalent. For example, let:

$$\square = 4$$

$$\bigcirc = 12$$

$$\triangle = 8$$

$$\hexagon = 6$$

Set up several pairs of ratios,

$$\frac{\square}{\hexagon} \text{ and } \frac{\triangle}{\bigcirc}, \square:\bigcirc \text{ and } \hexagon:\triangle$$

and ask the students to determine which pairs are equivalent.

The activity could be done as a student worksheet or as a class activity on the overhead.

A second activity might be to present students with one of the ratios and ask them to supply an equivalent ratio.

For example let: $a = 3$

$$b = 5$$

$$c = 9$$

$$d = 15$$

Sample questions could include:

1. What ratio is represented by $\frac{a}{b}$? _____
2. Write a ratio equivalent to the above ratio. _____
3. Represent this ratio using the letters. _____

Write a ratio equivalent to $\frac{a}{c}$ _____; $\frac{b}{d}$ _____; etc.

At this time you may also wish to acquaint students with the terminology "a is to b as c is to d."

A third activity could then ask students to supply pairs of equivalent ratios given four numbers.

For example:

Use the numbers 1, 12, 4, 3 and write as many pairs of equivalent ratios as you can.

Extension: Have students write 3 equivalent ratios using these numbers. 2, 9, 6, 3, 4 (The numbers may be used more than once.)

_____ = _____ = _____.

AS THE SQUARE TURNS

Recognizing Proportions
Getting Started
PROPORTION

This could be done as a teacher-directed activity using two square transparencies.

- (1) Make a square. Label it like this.

- (2) Flip the square over and label the back like this.

- (3) Look at the original square. See two ratios $\frac{1}{3}$ and $\frac{5}{15}$. Do the ratios form a proportion? (Yes or No) _____

- (4) Rotate the original square.

Ratios are $\frac{5}{1}$ and $\frac{15}{3}$.

Proportion? Yes $\frac{5}{1} = \frac{15}{3}$

- (5) Rotate again. Ratios $\frac{15}{5}$ and $\frac{3}{1}$.

Proportion? _____

- (6) Rotate again.

Proportion? _____

- (7) Flip the original square.

Proportion? _____

- (8) Flip the original square.

Proportion? _____

- (9) Flip the original square.

Proportion? _____

- (10) Flip the original square.

Proportion? _____

TYPE: Activity

AS THE SQUARE

URNS (CONTINUED)

TEACHER PAGE

Similar activities can be developed using a hexagon, octagon, etc. A general form can be generated using non-zero values to a , b , c , etc.

In the example on the student page
 $a = 1$, $b = 1$, $c = 5$, and $d = 3$.

Using the six rotations and six reflections of a regular hexagon, twelve proportions occur. The placement of the numbers that form the proportion are shown in the second diagram.

Using the eight rotations and eight reflections of a regular octagon, thirty-two proportions occur in each position of the octagon. The placement of the numbers that form the proportion are shown in the second diagram.

GETTING BULLISH ON PROPORTIONS

Multiplication Method
Getting Started
PROPORTION

Some proportions can be solved by multiplying. Study these examples.

① $\frac{3}{5} = \frac{\square}{15}$

② $\frac{8}{28} = \frac{2}{\square}$

③ 4 TO $\square$ = 8 TO 18 ④ $\square : 6 = 9 : 2$

$3 \times \frac{3}{5} = \frac{\square}{15}$

THE ARROWS
ALWAYS GO FROM
THE SMALLER TO
THE LARGER
NUMBERS

$\frac{8}{28} \leftarrow \frac{2 \times 4}{\square \times 4}$

$\frac{2 \times 4}{2 \times \square} = \frac{8}{18}$

$\frac{\square}{6} \leftarrow \frac{9 \times 3}{2 \times 3}$

$3 \times \frac{3}{5} = \frac{9}{15}$
3x

$\frac{8}{28} \leftarrow \frac{2 \times 4}{7 \times 4}$

$\frac{2 \times 4}{2 \times 9} = \frac{8}{18}$

$\frac{\square}{6} \leftarrow \frac{9}{2} \times 3$

Solve the proportions to discover the answer to this feed problem.

IF PAPA BULL (1200 POUNDS) CAN EAT 80 POUNDS
OF HAY IN 4 DAYS, AND BABY BULL (200 POUNDS)
CAN EAT 80 POUNDS OF HAY IN 24 DAYS, HOW
LONG WILL IT TAKE MAMA BULL (600 POUNDS)
TO EAT 80 POUNDS OF HAY?

$\frac{E}{35} = \frac{5}{7}$

$\frac{3}{5} = \frac{8}{25}$

THE BOB AND RAY SHOW

TEACHER DIRECTED ACTIVITY

Geometric Model
Getting Started
PROPORTION

This activity uses geometric models to determine equivalent ratios and can be used to solve simple proportions. Using the included script, taping the lesson in advance and/or having students present the lesson could provide a unique experience for your class.

Included in this activity are (1) a teacher page indicating the steps used to determine if two ratios are equivalent, (2) a transparency master for a demonstration of these steps, (3) a sample script that could be used with the demonstration and (4) a student page to follow up the activity.

- A. Is the ratio $\frac{5}{10}$ equivalent to the ratio $\frac{2}{4}$?

Use two rectangles that are the same size. Divide one vertically and one horizontally as shown and shade the appropriate parts, $\frac{5}{10}$ of one and $\frac{2}{4}$ of the other.

Transparency I

$$\frac{5}{10}$$

Transparency II

$$\frac{2}{4}$$

Place one rectangle on top of the other and draw in the dividing lines of each rectangle on the other.

Slide the rectangles apart and restate the ratios in terms of the new subdivisions.

Since $\frac{5}{10} = \frac{20}{40}$, and $\frac{2}{4} = \frac{20}{40}$, the ratio $\frac{5}{10}$ is equivalent to the ratio $\frac{2}{4}$.

$$\frac{5}{10} = \frac{20}{40} = \frac{2}{4}$$

- B. Is the ratio $\frac{2}{5}$ equivalent to the ratio $\frac{1}{4}$?

The same transparency master can be used for this demonstration.

Since $\frac{2}{5} = \frac{8}{20}$ and $\frac{1}{4} = \frac{5}{20}$, $\frac{2}{5} \neq \frac{1}{4}$.

THE BOB AND RAY SHOW (PAGE 2)

Transparency Master for Geometric Models

The audio portion of the lesson could be taped in advance. A sample text coordinated with teacher demonstration is presented below. To make the lesson more effective, fade out music completely before you begin speaking.

AUDIO	VIDEO
1. Musical Interlude 15 sec. (Select some song on album popular with students.)	
2. "Welcome to the Bob and Ray Show starring Rex Tangle. This program is brought to you by the Cross Products Company on radio station KPT located at 3.1415 on your dial."	
Musical Interlude 15 sec.	Place Transparency I on overhead
3. "Is the ratio $\frac{5}{10}$ equivalent to the ratio $\frac{2}{4}$?"	
Musical Interlude 10 sec.	
4. "Divide the rectangle vertically and shade to show $\frac{5}{10}$."	Demonstrate division to show $\frac{5}{10}$ on Transparency I and label.
Musical Interlude	Place Transparency II on overhead.
5. "Divide the rectangle horizontally and shade to show $\frac{2}{4}$."	Demonstrate division to show $\frac{2}{4}$ on Transparency II and label. Slide Transparency I over Transparency II.
Musical Interlude	
6. "Draw in dividing lines."	Draw in dividing lines. Slide Transparency II over Transparency I. Draw in dividing lines. Separate the two rectangles.
Musical Interlude	
7. "What ratio is now shown on Transparency I? on Transparency II?"	Write ratios next to rectangles. (See teacher page.)
8. "Since $\frac{5}{10} = \frac{20}{40}$ (pause) and $\frac{2}{4} = \frac{20}{40}$ (pause) the ratio $\frac{5}{10}$ is equivalent to the ratio $\frac{2}{4}$."	Point to both transparencies.
9. "Tune in next week when the Bob and Ray Show will present Harry Zontal and the Extremes."	
Musical Interlude	

THE BOB AND RAY SHOW (PAGE 3)

STUDENT PAGE

Use these rectangles to decide if the ratios are equivalent. Remember to divide one rectangle horizontally and the other vertically.

Students could cut the rectangles and hold them against a window to draw the other dividing lines.

? See if you can use rectangles to solve this proportion:

$$\frac{\square}{8} = \frac{3}{6}$$

Since 4 columns should be shaded
 $\frac{4}{8} = \frac{3}{6}$

$$\frac{\square}{8} = \frac{24}{48}$$

WE MUST WORK TOGETHER

Cross Products Method
Getting Started
PROPORTION

We are both found in proportions.
Do you know the mathematical meaning of mean? The means are in the middle.

In politics the extremes are the far left and far right.

$\frac{4}{6} \times \frac{10}{15}$ extremes are 4 and 15
means are 6 and 10.

WE "MEANS" HAVE SOMETHING IN COMMON WITH THOSE FAR OUT "EXTREMES."

DO YOU KNOW WHAT IT IS?

$$9:12 = 3:4$$

$$7:21 = 1:3$$

Complete the table.

	EXTREMES	MEANS	EXTREMES	MEANS
	9 and 4	12 and 3		
ADD THEM				22
SUBTRACT THEM	5			
MULTIPLY THEM				
DIVIDE THEM	$2\frac{1}{4}$			

Did you discover a rule? Does it work for these proportions?

a) $\frac{3}{5} = \frac{9}{15}$

c) $12:18 = 6:9$

b) $6 \text{ to } 12 = 1 \text{ to } 2$

d) $\frac{32}{12} = \frac{8}{3}$

AN EXTREME TOOL

Cross Products Method
Getting Started
PROPORTION

A discovery lesson for the Cross Products Rule is provided on the sheet, *We Must Work Together*.

The Cross Products Rule can be used to check if two ratios are equivalent or used to solve proportions. Rule: In a proportion the product of the extremes equals the product of the means.

Examples: $\frac{2}{4} = \frac{5}{10}$ $3:4 = 18:24$ $15 \text{ to } 10 = 6 \text{ to } 4$
 $2 \times 10 = 4 \times 5$ $3 \times 24 = 4 \times 18$ $15 \times 4 = 10 \times 6$
 $20 = 20$ $72 = 72$ $60 = 60$

Do these ratios form proportions?

Solve these proportions.

① $5:8 = 10:16$ < if Yes, connect A to D
if No, connect B to J

⑤ $3:9 = 4:\square$, if $\square =$ < 12, connect B to E
16, connect E to J

② $12 \text{ to } 3 = 36 \text{ to } 9$ < if Yes, connect I to L
if No, connect C to G ⑥ $\frac{4}{9} = \frac{\square}{18}$, if $\square =$ < 8 connect D to H
72, connect L to M

③ $\frac{4}{9} = \frac{21}{45}$ < if Yes, connect M to N
if No, connect G to L

⑦ $\frac{\square}{6} = \frac{12}{24}$, if $\square =$ < 72, connect D to O
3, connect G to J

④ $14:4 = 35:10$ < if Yes, connect H to K
if No, connect F to N

⑧ $9:4 = \square:20$, if $\square =$ < 80, connect Q to D
45, connect C to F

⑨ $5 \text{ to } \square = 15 \text{ to } 9$, if $\square =$ < 15, connect M to P
3, connect B to G

TYPE: Paper & Pencil/Puzzle

THE SOLVIT MACHINE - A DESK TOP PROPORTION CALCULATOR

TEACHER DIRECTED ACTIVITY

Cross Products Method
Getting Started
PROPORTION

- Needed for Construction:
- 1) A piece of pegboard, 5 holes by 9 holes.
 - 2) 4 wooden discs - about $1\frac{1}{4}$ in diameter.
 - 3) String and 8 brads.
 - 4) Chalkboard paint

- a) Paint the discs and the symbols with chalkboard paint.
- b) Put a staple on the back of each disc, loose enough to allow the disc to move freely along the string.
- c) Place the brads and strings in the positions shown. Thread a disc on each string.

EXAMPLE 1: $\frac{?}{2} = \frac{4}{8}$

$$\begin{array}{r} \textcircled{?} \times \textcircled{4} = \textcircled{4} \times \textcircled{?} \\ \hline \textcircled{2} \quad \textcircled{8} \end{array}$$

- a) The student writes the numbers on the discs.

$$\begin{array}{r} \textcircled{8} \times \textcircled{?} = \textcircled{4} \times \textcircled{2} \\ \hline \end{array}$$

- b) By sliding the lower discs carefully along the strings, the student can show the cross products.

$$\begin{array}{r} \textcircled{?} \times \textcircled{4} = \textcircled{4} \times \textcircled{2} \\ \hline \textcircled{8} \end{array}$$

- c) By sliding the coefficient of the unknown down the string, the student can see and compute the solution to the problem.

EXAMPLE 2: $\frac{5}{?} = \frac{15}{9}$

$$\begin{array}{r} \textcircled{5} \times \textcircled{15} = \textcircled{15} \times \textcircled{?} \\ \hline \textcircled{?} \quad \textcircled{9} \end{array}$$

$$\begin{array}{r} \textcircled{9} \times \textcircled{5} = \textcircled{15} \times \textcircled{?} \\ \hline \end{array}$$

$$\begin{array}{r} \textcircled{9} \times \textcircled{5} = \textcircled{?} \times \textcircled{15} \\ \hline \textcircled{15} \end{array}$$

The cross-products rule could be simulated at the blackboard by attaching magnets to the backs of note cards and by actually sliding the cards to exhibit the products.

TYPE: Activity/Manipulative
IDEA FROM: C.O.L.A.M.D.A.

$$\begin{array}{r} \boxed{3} \\ \boxed{8} \end{array} = \begin{array}{r} \boxed{9} \\ \boxed{?} \end{array}$$

$$\boxed{?} \times \boxed{3} = \boxed{9} \times \boxed{8}$$

PERSONALIZED PROPORTIONS

Solving Proportions
Getting Started
PROPORTION

TEACHER IDEA

The names and interests of students in your class can be a viable source of material for word problems. By directly involving the student (and teacher), story problems can be more interesting than those typically found in textbooks. Textbook problems, however, can be adapted simply by using the students' names. Personalizing word problems is a neat way for humanizing instruction and establishing teacher-student rapport. Here are some sample problems to be used in a proportion unit.

YOUR CLASS "TALKER"

1. Mark can talk at the rate of 16 words every 5 seconds. How many words can he say in a minute and a half?

THE CLASS "ATHLETE"

2. Brooks lifts a 4-ft. steel pipe that weighs 15 lbs. How much does he lift with a similar pipe that is 7 ft. long?

THE CLASS "BOOKWORM"

3. Doris can read 4 pages of a novel in 7 minutes. At this rate how long will it take her to read a chapter which is 26 pages long?

THE CLASS "PAPER THROWER"

4. Paul hits the wastebasket 4 times for every 6 wads of paper he throws. At the end of the week how many hits will he have if he tosses 30 wads of paper?

"GOOD MATH STUDENT"

5. June gets the top score on a math test: 29 out of 30. If she always does about the same, how many points would she get on a 100-point math test?

"TYPIST"

6. Amy can type 155 words in 5 minutes. How long would it take her to type a 2500-word English theme?

"EATER"

7. Derek's favorite candy bars cost 25¢ for 3. How much does he pay for 20 of them?

THROW ONE IN PER LESSON THAT CAN'T BE SOLVED

8. Cindy saved \$27 in 4 weeks. At that rate how much does she weigh if she is 5 feet, 2 inches?

THE STUDENT WHO ALWAYS "TRIES HARD"

9. _____ can correct math papers at the rate of 2 assignments every 3 minutes. How long will it take her to correct the papers from this class today. (There are _____ students here.)

10. Julie can work 3 math problems in 14 minutes. How long will it take her to do this worksheet?

Have the students make up some problems about each other.

TYPE: Paper & Pencil

PETITE PROPORTIONS 1

Solving Proportions
Getting Started
PROPORTION

Tired of those large numbers creeping into your problems? Want to avoid straining your brain? Pounce on the problem. Try **PETITE PROPORTIONS**, our most popular prescription, and become a positively perfect and proficient problem solver.

These exercises can be solved in many ways. Encourage students to use mental arithmetic and simplify to make the computation easier.

- 1) 13 heartbeats in 10 seconds. Sample solutions:
How many in 60 seconds?

1. 60 seconds
is 6 times
as long,
so there
would be
6 times as
many heart-
beats.
 $6 \times 13 = 78$
heartbeats

$$2. \frac{13 \text{ heartbeats}}{10 \text{ sec.}} = \frac{? \text{ heartbeats}}{60 \text{ sec.}}$$

$$13 \times 60 = 10 \times ?$$

$$\frac{13 \times \cancel{60}^6}{\cancel{10}^1} = ?$$

$$78 = ?$$

$$3. \frac{10 \text{ sec.}}{60 \text{ sec.}} = \frac{13 \text{ beats}}{? \text{ beats}}$$

$$\frac{1}{6} = \frac{13}{?}$$

$$? = 6 \times 13$$

$$? = 78 \text{ heartbeats}$$

Try these **PETITE PROPORTIONS**.

Divide before you find the final product.

- 2) 100 kilometres in 2 hours.
How many in 3 hours?

- 3) 5 hits every 15 times at bat.
How many hits in 75 times at bat?

- 4) 5 candy bars cost 59¢.
How much for 20 candy bars?

- 5) \$3.50 for 5 magazines.
How much for 10 magazines?

- 6) \$3.98 for 4 pounds.
How much for 2 pounds?

- 7) 4 cans of beans for \$1.00.
How much for 6 cans?

- 8) Run 50 metres in 8 seconds.
How many in 4 seconds?

- 9) 6 donuts for 53¢.
How much per dozen?

- 10) 21 problems solved in 3 minutes.
How many solved in 24 minutes?

- 8) 20 minutes to do 30 math problems.
50 minutes to do _____ math problems.

- 9) 2 pantsuits for \$35.
7 pantsuits for _____.

- 10) 2 cm on a map represents 100 km.
5.3 cm represents _____ km.

- 11) Car goes 10 km on 2 litres of gas.
Car goes _____ km on 16 litres of gas.

- 12) Check 14 cars in 30 minutes.
Check _____ cars in 75 minutes.

TYPE: Paper & Pencil

No particular method is suggested for solving these problems. Mental arithmetic is to be encouraged. The cross-products rule can be used to check the solutions.

DID YOU KNOW THAT . . .

Solving Proportions
Getting Started
PROPORTION

There is an 8-word, 32-letter sentence that uses all 26 letters of the alphabet. The sentence is a great typing exercise.

Solve the proportions to discover the sentence. Write the problem letter under the answer to the problem in the table below.

A 8 correct out of 15.
___ correct out of 75.

B 1 inch represents ___ miles.
10 inches represents 500 miles.

C 5000 revolutions per minute.
___ revolutions per 15 minutes.

D 45 words per minute.
225 words per ___ minutes.

E 17 miles per gallon.
238 miles on ___ gallons.

F ___ yards per pass.
162 yards on 9 passes.

G ___ heartbeats per minute.
19 heartbeats per 15 seconds.

H 10 feet in 20 seconds.
___ feet in 60 seconds.

I 12 apples for 60¢.
___ apples for \$1.00

J ___ for 1 pound.
\$1.95 for 3 pounds.

K 46 hits out of 200 times at bat.
___ hits out of 1000 times at bat.

L ___ for 3 cans.
\$1.55 for 5 cans.

M 55 miles in 1 hour.
385 in ___ hours.

N \$.74 for 1 dozen.
___ for 6 dozen.

O ___ pounds per cubic foot.
150 pounds per 6 cubic feet.

P ___ made out of 56 tries.
5 made out of 8 tries.

Q 250 kilometres on 40 litres.
50 kilometres on ___ litres.

R 240 kilometres in ___ hours.
80 kilometres in 1 hour.

S 3 centimetres represents 90
kilometres.
___ centimetres represents
180 kilometres.

T \$4.00 per hour.
___ for 8 hours.

U 100 won out of 150 played.
10 won out of ___ played.

V \$200 per month.
\$2400 per ___ months.

W 3° rise in 1 hour.
12° rise in ___ hours.

X 4 beats per measure.
36 beats in ___ measures.

Y ___ for 5 yards of fabric.
\$2.50 for 1 yard.

Z 3 tennis balls per can.
___ tennis balls in a dozen
cans.

COUNTEREXAMPLE

TEACHER DIRECTED ACTIVITY

Recognizing Incorrect
Proportions
Getting Started
PROPORTION

Much emphasis is given in mathematics to finding the correct solution to a problem. This activity is one designed to have the student find a counterexample by substituting values to make the statement false. Several of these examples could be tried with a group of students, and the remaining problems could be used as a competition between two groups of students.

Two alternative methods are (1) making a bulletin board display of the problems and allowing students to write the counterexample on the display when one is discovered or (2) giving an individual student the problems to work on.

As well as finding counterexamples, students should also be encouraged to find at least one set of values that makes the problem true. Students should know that some of the problems are true, and no counterexample exists.

$\frac{a}{d} = \frac{b}{c}$	$\frac{d}{a} = \frac{c}{b}$	$\frac{ab}{b} = \frac{cd}{d}$	$\frac{a+b}{b-a} = \frac{c+d}{c-d}$
$ac = bd$			$\frac{a}{c} = \frac{b}{d}$
$\frac{a+1}{b} = \frac{c+1}{d}$	$\frac{a-b}{b} = \frac{c-d}{c}$	$\frac{c}{b} = \frac{a}{d}$	$\frac{b}{a} = \frac{d}{c}$
$ab = cd$			$1 + \frac{a}{b} = 1 + \frac{c}{d}$
$\frac{a}{b} + 1 = \frac{c+1}{d}$	$1 + \frac{a}{b} = \frac{c}{1+d}$	$\frac{a+b}{b} = \frac{c+d}{c}$	$\frac{a-b}{a+b} = \frac{d-c}{c+d}$

Assume $\frac{a}{b} = \frac{c}{d}$ and none of a , b , c , or d are zero. Try to find counterexamples for each of the problems. Shade the problems that have counterexamples to find a letter in the alphabet. E

Solution strategy--If $\frac{a}{b} = \frac{c}{d}$, does $\frac{a-d}{b} = \frac{c-b}{d}$? Use a simple proportion $\frac{1}{2} = \frac{2}{4}$ where $a = 1$, $b = 2$, $c = 2$, $d = 4$. Then $\frac{a-d}{b} = \frac{c-b}{d}$ becomes $\frac{1-4}{2} \neq \frac{2-2}{4}$ and this set of values is a counterexample.

PROPORTION PROJECTS TO PURSUE

TEACHER IDEAS

Application
PROPORTION

- 1) In an almanac find the world records for the 100-metre dash, 400-metre dash, 1500-metre run, and the 3000 metre run. Are the rates of distance to time for each race proportional? If a 6000-metre run were a track event, predict the world record time.

- 2) Go to the supermarket and find several sizes of the same product. Record the prices and the net weights (weight of contents only) of the different sizes. Are the rates of price to net weight proportional? Investigate cereals, soap powders, shampoos, hamburger, and sugar.

- 3) Check the phone book and approximate the number of Smiths living in your city and surrounding area. Choose several other cities and approximate the number of Smiths living in these cities. (Most public libraries have phone books of other cities.) Compare the ratios of number of Smiths to total population for each city. (Remember to use the total population of the city and surrounding area.) Are the ratios proportional? Use the ratio of your city to predict the number of Smiths living in San Francisco; New York; your state, the United States.

IDEA FROM: The School Mathematics
Project, Book 2

PROPORTION PROJECTS TO PURSUE

(CONTINUED)

- 4) From the post office get the rates for mailing letters and packages. Is the cost of mailing a light package proportional to the cost of mailing a large package? Is the cost of mailing a package a short distance equivalent to the cost of mailing the same package a long distance?

- 5) From a catalog of Montgomery Ward, Penney, Sears Roebuck, or Spiegel, find the shipping rates for orders. Is the cost of shipping a light package proportional to the cost of shipping a heavy package? Is the cost of shipping a package a short distance proportional to the cost of shipping the same package a long distance?

- 6) Find out the cost of train fare from your nearest railroad station to four other stations. Are the rates of cost to distance traveled proportional for the trips?

Find the same information for buses and airplanes. Which of the three types of transportation has the most consistent rate?

ONLY THE SHADOW KNOWS

Using Proportions
to find Heights
Application
PROPORTION

Materials needed: 2 students, a book, a metre stick, a metric tape measure, charts for recording data, metre wheel (optional).

1

Before going outside to measure shadows, measure each height to the nearest centimeter and record the data on the chart.

Name	Height of Object	Length of Shadow	Ratio of Height to Length
a) Student A			
b) Student B			
c) Book			
d) Metre Stick			

2

Go outside and measure the shadows. For the students measure from the heel as they face the sun. Record the data in the chart. Write the ratios in simplest form. Are the ratios equivalent?

You may need my help, too

3

Find some objects too tall to measure directly. Measure these shadows correct to the nearest decimetre. Some objects are suggested in the chart to the right. There is space for you to include other objects. Wait until you are back in the classroom to compute the heights. A calculator can help you.

Object	Height of Object	Length of Shadow
Flagpole		
Short tree		
Tall tree		
Goalpost		
Telephone pole		

4

To find the heights of the objects in the second chart, use the ratio from the first chart, set up a proportion, and solve.
For example:

Lonnie	150 cm	200 cm	$\frac{150}{200} = \frac{3}{4}$
--------	--------	--------	---------------------------------

Tall tree	126 dm	168 dm	
-----------	--------	--------	--

5

Find the heights of the objects in your chart. Compare your results with other groups. Are they the same? What information in the charts will change if this activity is done at a different time of day?

$$\begin{aligned} \frac{3}{4} &= \frac{\square \text{ (height)}}{168 \text{ (shadow)}} \\ 3 \times 168 &= 4 \times \square \\ 504 &= 4 \times \square \\ 126 &= \square \end{aligned}$$

Fill in this space with the method you want your students to use.

Foreign Exchange

NEW YORK (AP) — Tuesday Foreign exchange in dollars and decimals of a dollar, New York prices.

	Tues.	Fri.
Argentina (peso)	.0908	.0500
Australia (dollar)	1.3575	1.3500
Austria (schilling)	.0415	.0410
Belgium (franc)	.028675	.028900
Brazil (cruzeiro)	1310	1310
Britain (pound)	2.3240	2.3240
30 Day Futures	2.3175	2.3170
60 Day Futures	2.3090	2.3090
90 Day Futures	2.3010	2.3000
Canada (dollar)	.9760	.9750
Colombia (peso)	.0340	.0340
Denmark (krone)	1.860	1.850
France (franc)	.2525	.2515
Holland (guilder)	.4168	.4165
Hong Kong (dollar)	.2050	.2050
Israel (pound)	.1800	.1800
Italy (lira)	.001615	.001610
Japan (yen)	.003440	.003440
Mexico (peso)	.0801	.0801
Norway (krone)	.2040	.2035
Portugal (escudo)	.0425	.0415
South Africa (rand)	1.4750	1.4750
Spain (peseta)	.0180	.0181
Sweden (krona)	.2360	.2360
Switzerland (franc)	.4050	.4030
Venezuela (bolivar)	.2340	.2340
W. Germany (dchmark)	.4300	.4295

This chart is taken from the financial page of a newspaper. It can be used as a source of many proportion exercises. Students can bring the chart from home. Before starting an activity, explanation of the chart may be necessary; necessary, i.e., 1 peso = \$.09, 1 Sweden krona = \$.256, and 1 South Africa rand = \$1.475. Explanation of the decimal part of a cent may also be necessary.

Exercises could be developed like the ones that follow.

- A family planning a trip to the United States wishes to exchange 1000 dchmark. What country is the family from? _____ How much American money will the family receive according to the Tuesday exchange rate? _____
- An American businesswoman will be visiting a factory in Hong Kong. She wishes to exchange \$2000 into Hong Kong dollars. About how many will she get? _____
- An investor in Belgium has 1,000,000 francs to exchange. Which would have been the better day to make the exchange? _____ How many more American dollars would the investor receive by choosing the better day? _____
- An unlucky investor waited until Friday to exchange 700,000 Australian dollars to American dollars. How much did he lose by waiting? _____ Should he keep his money and wait until next week? _____
- A livestock buyer will be going from the United States to Spain and then to Argentina. To avoid exchanging the peseta back to American dollars and then to peso, find the exchange rate between peseta and peso.

One solution strategy:

$$\left. \begin{array}{l} 1 \text{ peso} = \$.09 \rightarrow 200 \text{ peso} = \$18.00 \\ 1 \text{ peseta} = \$.018 \rightarrow 1000 \text{ peseta} = \$18.00 \end{array} \right\} \rightarrow 200 \text{ peso} = 1000 \text{ peseta, so} \\ 1 \text{ peso} = 5 \text{ peseta}$$

- Investigate the different coins of a country. Is the value of each coin related to the decimal system or to some other place value system?
- Investigate the monetary system of countries not listed on the exchange table. Can you find the exchange rate according to an American dollar?

TYPE: Paper & Pencil

STRETCH

SMITH

Using Proportions to
Check a Prediction
Application
PROPORTION

"Stretch" Smith, a basketball star, predicts his age and height will remain in the same ratio. At 12 years "Stretch" was 160 centimetres tall.
Age : Height = 12 yrs. : 160 cm

Complete the tables:

How Tall Will "Stretch" Be?

A	H
12 Yrs.	160 cm
15 Yrs.	
18 Yrs.	
24 Yrs.	
30 Yrs.	
36 Yrs.	

How Old Was "Stretch"?

A	H
12 Yrs.	160 cm
Yrs.	120 cm
Yrs.	80 cm
Yrs.	40 cm
Yrs.	20 cm
Yrs.	10 cm

- Graph the information from the tables.
- What do you notice about the graph?
- Use the graph to approximate his height at these ages.
 - A = 0 yrs., H = _____
 - A = 33 yrs., H = _____
 - A = 4 yrs., H = _____
 - A = 50 yrs., H = _____
- Use the graph to approximate his age when his height has these values.
 - A = _____, H = 30 cm
 - A = _____, H = 100 cm
 - A = _____, H = 600 cm
 - A = _____, H = 0 cm

Are your age and height proportional, that is, do they stay in the same ratio?

Does "Stretch" know what he is talking about?

Can you think of any two things about you that are proportional?

TYPE: Paper & Pencil

ONE GOOD TURN DESERVES ANOTHER

Using Proportions to
Determine Distances
Application
PROPORTION

TEACHER DIRECTED ACTIVITY

I'm called a big wheel
because I go around
in circles.

Materials needed: 1 bicycle wheel or a round piece of wood
1 tape measure
1 piece of rope
1 roll of masking tape

A bicycle and/or tricycle wheel could be used. If both are used, students could compare the results. Mounting the wheel in a simple frame will make it easy to roll.

Activity 1: Place a marker on the wheel. Tape a straight line on the floor approximately 4 metres long. Place the wheel so the marker is at one end of the tape. Carefully roll the wheel 1 turn along the tape. Measure this distance in centimetres or feet. Repeat this to check your measurement. Write the ratio that compares 1 turn of the wheel to the distance measured (the circumference of the wheel).

1 turn: _____ (feet or centimetres)

This ratio can now be used in the following activities to measure distances. Students should be encouraged to first estimate the distances to be measured. The students can place markers on the wheel to show $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ of a turn to increase their accuracy.

Activity 2: Find the length and width of your classroom.

Activity 3: Find the length of the sideline and baseline of your basketball floor.

Activity 4: Use the ratio to find the number of turns needed to go 50 metres. Check the answer with the wheel.

Activity 5: Tape the rope to the floor in a curved line and use the wheel to find its length.

TYPE: Activity
IDEA FROM: Selected Investigations
for Math Lab

THAT'S THE WAY THE OLD BALL BOUNCES

Using Proportions to
find Heights
Application
PROPORTION

Materials needed: Tennis ball
Metre stick
Strip of paper or tape
3 metres long

- (1) Use the metre stick to mark the strip of paper (tape) into decimetres. Mount the strip of paper on the wall. Be sure the zero mark is at the base of the wall.
- (2) Drop the ball from the heights listed in the table. Each time write down the height of the first bounce. Repeat the drops to check the accuracy of your readings. Select four different heights for the last four trials.

Height of bounce in decimetres								
Height of drop in decimetres	10dm	15dm	5dm	20dm				

- (3) Examine the table and compare the ratio: $\frac{\text{height of bounce in decimetres}}{\text{height of drop in decimetres}}$ for the various drops.

If you measured carefully, the eight ratios should be nearly equivalent. Since the ratio of the height of the bounce to the height of the drop is nearly the same, we can say that "the bounce is proportional to the drop."

- (4) Use this information to complete the following:
If the height of the drop is 40 decimetres, the bounce will be about _____.
If the height of the bounce is 7 decimetres, the ball was dropped from a height of _____.

After doing this activity, have students do the activity with a golf ball or superball.

- 1) a) Move the two gears so that the *'s meet.
b) Turn gear A one complete turn. How many turns does gear B make? _____
c) Complete Table 1.
d) What do you notice about the ratios in the last column?
e) If gear A turns 12 times, how many times does gear B turn?

- 2) a) Attach gears A and C and move them so that the *'s meet. Fill in the table.
b) Now attach gears A and D so the *'s meet and fill in the table.

TABLE 2

Number of turns made by gear A	Number of turns made by gear C	Ratio of turns by gear A: turns by gear C	Number of turns made by gear A	Number of turns made by gear D	Ratio of turns by gear A: turns by gear D
1			1		
2			2		
3			3		

If gear A turns 12 times, gear C turns _____ times, and gear D turns _____.

- 3) Attach gears B and C and move them so that the ●'s meet. Turn them until the dots meet again and count the number of turns made by each gear.
 - a) Number of turns made by gear B _____.
 - b) Number of turns made by gear C _____.
 - c) Ratio of turns by gear B : turns by gear C = _____:_____.
 Align the dots and move gear B twice the number of turns made in part (a). Do the dots meet? _____ How many turns did gear C make? _____
 d) Ratio of turns by gear B : turns by gear C = _____:_____.
 Compare the ratios in (c) and (d).
 If gear B turns 24 times, gear C turns _____.

one heckuva mesh (PAGE 3)

- 4) Attach gears B and D. Align the dots and turn the gears until the dots meet again.
Write the ratio, turns by gear B : turns by gear D = ____:____.
- 5) Write a turn ratio for gears C and D. ■'s have been marked to help you.
Turns by gear C : turns by gear D = ____:____.
- 6) Ratios can be used to compare the number of teeth on gears. Count the teeth on each gear and record. Complete the ratio table.

TABLE 3

Gear	Number of teeth
A

B to D	to	to
C to D	to	to

TABLE 4

- 7) Compare the first ratio in Table 1, turns by gear A : turns by gear B = ____:____, to the simplified teeth ratio of gear A to B in Table 4, ____:____.

Compare the first ratio in Table 2, turns by gear A : turns by gear C = ____:____, to the simplified teeth ratio of gear A to C in Table 4, ____ to ____.

Do you see a pattern?

Can you explain?

- 8) Use the simplified teeth ratio of gear A to D from Table 4 to help answer this question:
If gear A turns 5 times, how many times does gear D turn? ____
Check your answer by turning the gears.

- 9) If gear X turns 40 times, gear Y turns ____.

GET IN GEAR

TEACHER DIRECTED ACTIVITY

Using Proportions
with Gears
Application
PROPORTION

Have a student bring a 5 or 10 speed bicycle to class. Turn the bike upside down so that the gears can be shifted. Put a piece of tape on the rear wheel of the bicycle. Have the students count the teeth in each gear and record in Table 1. (The number is not standard. The front gears vary from 52 to 39 teeth and the rear gears from 34 to 14.)

Write the gear ratios and simplify.
Record in Table 2.

The following activities are suggested for student investigation:

TABLE 1

Gear	Number of teeth
X	
Y	
A	
B	
C	
D	
E	

TABLE 2

Gear Ratio	Ratio of number of teeth	Simplified Teeth Ratio
X to A		
X to B		
X to C		
X to D		
X to E		
Y to A		
Y to B		
Y to C		
Y to D		
Y to E		

1. Select a simple gear ratio, for example, 13 to 4, and set the gears to correspond. Check the gear ratio by slowly turning the pedals. The pedals should turn four times and the wheel thirteen. (Hold the rear tire lightly to aid in counting the turns of the wheel.) Check some other gear ratios by counting pedal and rear wheel turns.

2. Select a back gear and use the small front gear. Turn the pedals slowly and shift to the large front gear. Continue turning the pedals at the same rate. What change do you notice in the back wheel? Can you explain? What are the corresponding gear ratios?

3. Move the gearshifts so the chain is on the smallest back and front gears. Turn the pedals at a constant rate. Shift only the back gear so that the chain travels from the smallest to the largest gear wheel. What change occurs in the back wheel? Can you explain. What are the corresponding gear ratios?

4. If the pedals were turned at a constant rate, which ratio would cause the back wheel to turn the fastest? Order the simplified gear ratios from largest to smallest. Students could use a calculator to change each ratio to a decimal and then order the decimals.

5. In riding the bicycle, which gear setting is the easiest to pedal? the most difficult? Experiment on the playground. Which gear setting allows you to travel the farthest for one turn of the pedal? Devise a method for checking your prediction.

6. Select a gear setting. Suppose you pedal at a constant rate (one turn per second, thirty turns per minute, etc.). How far would you travel in 20 minutes?

7. Select a gear setting. How many turns of the pedal are needed for the bike to travel a distance of one mile?

The state of Oregon has the following speed laws.

20 MILES PER HOUR

- In any business district.
- When passing school grounds or crosswalks when children are present and signs are posted.

25 MILES PER HOUR

- In any residential area.
- On ocean beaches, where motor vehicles are permitted. (A maximum limit, or as posted.)
- In city public parks, unless otherwise posted.

55 MILES PER HOUR
■ On the open highway in locations other than those already mentioned, unless otherwise posted.

I. Find out the speed laws for your state or use those for Oregon to answer these questions.

- 1) What is the speed limit in kilometres per hour in front of your school?

1 mile $\approx$ 1.6 kilometres

- 2) What is the speed limit in kilometres per hour in front of your home?
- 3) What would be a reasonable speed limit in kilometres per hour for freeway driving in your state?
- 4) If a trailer is being towed by a pickup or truck, the maximum speed limit is 50 miles per hour. What is the speed in kilometres per hour?

5)

40 mph

This curve can be safely driven at _____ kilometres per hour.

- 6) What speed in kilometres per hour will cars be going in the Indianapolis 500? Use an almanac to help you.

TYPE: Paper & Pencil

LIMIT YOUR SPEED

(Continued)

II.

STOPPING DISTANCES OF STANDARD PASSENGER CARS

MILES PER HOUR	DRIVER REACTION DISTANCE FT.	BRAKING DISTANCE FT.	TOTAL STOPPING DISTANCE FT.
20	22	18-22	40-44
30	33	36-45	69-78
40	44	64-80	108-124
50	55	105-131	160-186
60	66	162-202	228-268

Application
PROPORTION

TEACHER DIRECTED ACTIVITY

Materials needed: Ten-foot plank, four-inch concrete building block, bathroom scale, measuring tape, metre or yard stick.

- I. Balance the plank by placing the block in the middle. Ask for a volunteer (or the teacher) to stand on one end of the plank. Have different members of the class try to balance the plank by standing on the opposite end. For the plank to balance students should realize the weights of the volunteers should be about equal. Weigh the volunteers.
- II. Pick two members of the class having different weights. Weigh them and record the weights. Keep the block in the middle and ask them to stand on opposite ends of the plank and balance each other. Students will probably use their previous experience with teeter-totters to accomplish the task.
- III. Again pick two members of the class having different weights. This time their task is to stand on the ends of the plank and balance it by moving the block.
- IV. Have the students use the three activities above to formulate a conjecture about how a balance occurs. Students will probably say that the heavier weight is closer to the block, and the lighter weight is farther away from the block.
- V. Ask students to examine the relationship between the weights and distances by completing a table. By using two students whose weights are considerably different, a pattern can be discovered. The results in the last column will be approximately equal.

Weight of person (w)	Distance w is from block (D)	$W + D$	$W - D$	$W \div D$	$W \times D$

The General Rule is : $W_1 \times D_1 = W_2 \times D_2$, or $\frac{W_1}{W_2} = \frac{D_2}{D_1}$.

- VI. Students can apply the general rule to solve problems: For example, John weighs 90 lbs. and stands 4 feet from the block. Tim balances the plank by standing 3 feet from the block. How much does Tim weigh?

Earth

Fulcrum

"Give me a place to stand, and I will move the Earth."

This is what the famous Greek scientist Archimedes (287-212 B.C.) was supposed to have boasted after discovering the law of the lever: $W_1 \times D_1 = W_2 \times D_2$. Assume that

Archimedes weighs 150 lbs., and the fulcrum of the lever is 4,000 miles from the Earth. How far from the fulcrum would he have to stand in order to move the Earth? The Earth weighs 13,176,000,000,000,000,000,000 lbs.

If a plank is not available, a 1-metre board can be used to balance several objects.

IM BEAT! HOW ABOUT YOU?

Using Proportions
with Gears

Application
PROPORTION

Materials: 1 hand eggbeater

- (1) Turn the crank one complete turn and have your partner count the number of turns of the beater. _____
- (2) How many beater revolutions are there when you turn the crank 4 times? _____
6 times? _____
- (3) Write a ratio showing the number of beater revolutions for 1 turn of the crank. _____
- (4) Predict the number of beater revolutions if the crank makes 8 turns. _____
Check your prediction by turning the crank and counting.
- (5) If the beater revolves 45 times, how many times will the crank turn? _____

- (6) Count the teeth in each gear and record your answer. _____, _____
Write a ratio that compares the number of teeth in the large gear to the number of teeth in the small gear. _____
- (7) There are _____ teeth in the large gear for each one tooth in the small gear. Write this ratio. _____ This ratio should be equivalent to the ratio in question 6.
- (8) Compare the ratio in question 3 to the ratio in question 7. (Beater revolutions : 1 turn of the crank = number of teeth in large gear : 1 tooth in small gear)
- (9) Is the ratio of beater revolutions to turns of the crank always equivalent to the ratio of the teeth in the large gear to the number of teeth in the small gear? Use the information in questions 4 and 6 to help you decide. _____
beater revolutions : 8 turns of the crank = _____ teeth in large gear : _____ teeth in small gear.
- (10) An egg beater has gears with 64 and 14 teeth each. If the crank is turned 28 times, how many revolutions will each beater make?
- (11) In making the meringue for a lemon meringue pie, you must beat the egg whites until they are stiff. This may take 4 minutes of rapid beating. If you turned the crank 100 times a minute, how many times would each beater revolve during the 4 minutes?

I mean to be
MEAN!

Determining Mean
Proportions
Application
PROPORTION

A proportion is a mean proportion when the two means are equal.

$$\frac{\text{Hexagon}}{\text{Angry Face}} = \frac{\text{Angry Face}}{\text{Triangle}}$$

I'm a mean
proportional
between

Circle the proportions that are mean proportions.

$$\frac{1}{7} = \frac{7}{49}$$

$$\frac{6}{5} = \frac{6}{5}$$

$$\frac{4}{2} = \frac{2}{1}$$

EXAMPLES:

A) Find a mean proportional between 3 and 12.

Solution:

$$\frac{3}{\text{Angry Face}} = \frac{\text{Angry Face}}{12}$$

$$\begin{aligned} 3 \times 12 &= \text{Angry Face} \times \text{Angry Face} \\ 36 &= \text{Angry Face} \times \text{Angry Face} \\ 6 &= \text{Angry Face} \end{aligned}$$

Find the mean proportional between:

- a) 4 and 16
- b) 5 and 45
- c) 2 and 50
- d) 8 and 2
- e) 100 and 4

B) Find an approximate mean proportional between 12 and 4.

Solution:

$$\frac{12}{\text{Angry Face}} = \frac{\text{Angry Face}}{4}$$

$$\begin{aligned} 12 \times 4 &= \text{Angry Face} \times \text{Angry Face} \\ 48 &= \text{Angry Face} \times \text{Angry Face} \\ 6.9 &\approx \text{Angry Face} \end{aligned}$$

7x7=49, so
I'm a little
less than
7, about 6.9

Student approximations can be checked by multiplication with a calculator or with paper and pencil, or by square roots on a calculator or with a table.

The geometric mean between two numbers is a mean proportional. For example, 1, 3, 9, ?, 81, ...

$$\frac{9}{n} = \frac{n}{81}; n = 27$$

See *Making Means Meaningful* for an application of mean proportions.

Approximate the mean proportional between:

- a) 3 and 16
- b) 5 and 7
- c) 8 and 4
- d) 5 and 3
- e) 12 and 4

? Challenge: Find three pairs of numbers for which 8 is the mean proportional.

MAKING 'MEANS' MEANINGFUL

Applying Mean Proportions
in a Right Triangle
Application
PROPORTION

In each right triangle below draw a line through B perpendicular to the line through A and C. Where the two lines cross, label the point E. Measure the line segments AE, EC, and BE to the nearest centimetre and record below to complete each ratio.

① $\frac{AE}{BE} = \frac{4\text{cm}}{2\text{cm}}$ $\frac{BE}{EC} = \underline{\hspace{2cm}}$

② $\frac{AE}{BE} = \underline{\hspace{2cm}}$ $\frac{BE}{EC} = \underline{\hspace{2cm}}$

Compass and straightedge
can be used to construct
the mean proportional
between any two lengths.

$$\frac{a}{m} = \frac{m}{b}$$

③ $\frac{AE}{BE} = \underline{\hspace{2cm}}$ $\frac{BE}{EC} = \underline{\hspace{2cm}}$

④ $\frac{AE}{BE} = \underline{\hspace{2cm}}$ $\frac{BE}{EC} = \underline{\hspace{2cm}}$

In each problem what do
you notice about the ratios

$$\frac{AE}{BE} \text{ and } \frac{BE}{EC}$$

When two ratios are equal,
they form a proportion.

$$\frac{AE}{BE} = \frac{BE}{EC}$$

The extremes are AE and EC.

The means are BE and BE.

Since the means are equal, the
proportion is called a mean
proportion.

BE is the mean proportional.

TYPE: Paper & Pencil

SCALING

SCALING

THE MEANING AND USES OF SCALING

The words scale and scaling are used in many different ways. The scale that B. C. has suggested in the cartoon above is a common scale for rating performance. There are also pay scales, musical scales, and scales for comparing weights and temperatures. In this resource the word scale will refer to a ratio. A scale of 1 cm : 2 km can be interpreted as the ratio 1 cm for every 2 km. The scale might be useful on a city map where 1 cm on the map represents 2 km in the actual city. A scale (ratio) of 1 cm : 100 people might be used as a basis for a number line graph.

Scaling means to make use of a scale. Some examples of scaling are: finding distances with a map using the given scale, scaling a recipe up or down according to a given ratio, and making a scale enlargement or reduction of a drawing.

Scale Drawings

Scale drawings are indispensable in the design and construction of objects. The huge tire shown in the picture at the right was designed from small scale drawings. Most manufactured objects were initially drawn to a scale. The dimensions of a scale drawing may be smaller than, equal to, or larger than the dimensions of the object.

If a 1,996-pound tire falls on a 25-pound dog--

Being "dog tired" was evidently taken literally by this little beagle who was photographed recently in Zanesville, Ohio, taking a morning rest in the center of a huge earth mover tire. The account went on to point out that the tire weighs 1,996 pounds and the dog weighs 25 pounds, the importance of which isn't exactly clear unless the tire falls on the dog. Then the dog's dimensions are going to be about three feet long, three feet wide and an eighth of an inch thick.

Small objects, such as those found in clocks, transistors, radios and miniature calculators, are scaled up so they can be conveniently designed. Buildings, cars, furniture, clothing and other relatively large objects are scaled down to fit on blueprint and drawing paper.

When the dimensions of the scale drawing are equal to the dimensions of the object the scale drawing is said to be to actual size. This scale drawing of the grasshopper is drawn to size with a scale of 1 to 1 (1:1).

Drawn to Actual Size

Scale of 1:1

When the dimensions of the scale drawing are greater than the dimensions of the object, the scale drawing is called an enlargement. The scale drawing shown below is a 2 to 1 enlargement. Using ratio notation, this can be written as 2:1. Using fraction notation, we can write $\frac{2}{1}$ and say that the scale factor is two. (A few textbooks reverse the notation for scales and instead of writing 2:1 enlargement as we have here, they will write 1:2 enlargement.)

Enlargement

Scale of 2:1

When the dimensions of the scale drawing are smaller than the dimensions of the object, the scale drawing is called a reduction. This scale drawing of the grasshopper is a 1 to 2 (1:2) reduction. In this case, we can say that the scale factor is $\frac{1}{2}$.

Reduction

Scale of 1:2

"Twice as Large"

On the student page *Be Creative This Christmas* an excerpt from a magazine states, "If you want to make the original design twice as high and twice as wide, make the square twice as large." While it is common to speak of something as being twice as large when its linear dimensions are doubled, this practice can be a source of confusion. For example, the sides of square B are twice as long as the sides of square A, and yet its area is four times as great.

SQUARE A SQUARE B

This newspaper clipping says that the big knife is three times larger than the conventional Scout knife. This means that the length and width are three times as great. As in the above examples, the comparison of sizes refers to the linear dimensions and not to the surface area, volume or weight. For example, the weight of the large knife is $4\frac{1}{4}$ pounds, and this is much more than 3 times the weight of a conventional Scout knife.

While such expressions as, "twice as large," "three times as large," "half as big," etc., usually refer to lengths, there are exceptions. If a farmer

speaks of one plot of land as being twice as large as another, he is referring to the area or acreage and not the length and width. If he wants a silo which is twice as large, then he is referring to a volume which is twice as large and not the height or width of the silo. The change in area and volume as related to a scale is discussed further in this commentary under "Supplementary Ideas in Scaling."

Prepared for anything

What could be the world's largest Scout-type knife is ready for the world's largest potato. Wayne Goddard, a professional knife-maker who works at his home at 473 Durham St., Eugene, turned this one out for Dennis and Raymond Ellingsen, Eugene knife collectors. Completely functional, the knife is 24½ inches long when opened. It weighs 4¼ pounds and is three times larger than the conventional Scout knife.

GETTING STARTED ON SCALING

Representation

Representation is very important in the study of scaling. Bar graphs use a given scale to represent information. Maps represent geographic areas based on the scale given in the legend of the map. Since scaling is often concerned with representing information and/or objects, you might like to begin a unit on scaling with some discussion of representations. Students can be asked to think of pictorial ways to represent or identify people. They might think of snapshots, shadow profiles, fingerprints or sketches. The student page *Elementary, My Dear Watson* would be appropriate here.

The page *What Am I?* can be used to begin a discussion on identifying objects from their outlines. When do we need to know more than size and outline to identify something?

Scales on Enlargements or Reductions

Representations of objects can be the same size, smaller than or larger than the objects. This idea can be introduced along with the use of ratio notation for scales with the page *Bug Off!* The page shows three scale drawings of a grasshopper, one of which is identified as actual size. (Note: if you show the page on an overhead screen, your students might point out that all of the grasshoppers are enlarged.)

Once students know the meaning of the scales 1:2, 1:3, they can be given activities which require them to determine the scale. The student pages *What Scale?* and 1776-1976 offer opportunities for this.

WHAT SCALE?

SCALE OF ____ : ____

ELEMENTARY, MY DEAR WATSON

Equipment: Two 4" x 6" index cards
Ink pad
Magnifying glass

1. Pick a partner.
2. Use an index card. Rule and label the card as shown.
3. Use an ink pad and record your fingerprints.
4. Clean your fingers thoroughly.
5. Use the magnifying glass to study your prints. How do the prints differ? Count the ridges or loops in different parts of one fingerprint.
6. The Henry system divides finger prints into eight types of patterns for identifications. Study the patterns below and try to classify your fingerprints.
7. Carefully describe two of your fingerprints to your partner. See if your partner can select the correct ones.

THUMB	INDEX	MIDDLE	RING	Little
Left	Left	Left	Left	Left

1 Plain arch	2 Tented arch	3 Radial loop	4 Ulnar loop
5 Plain whorl	6 Central whorl	7 Double loop	8 Accidental

SCALE OF 1:250

A scale can be used to determine the measurements of an object. The scale of 1:250 is given for the dinosaur from the page *A Picture is Worth a Thousand Words*. Since the scale drawing of the dinosaur is about 2.5 cm tall, it can be determined that the dinosaur is about 625 cm (2.5×250) or 6.25 metres tall.

Choosing an appropriate scale to make a scale drawing is sometimes difficult. What scale would be useful for drawing a paramecium? What scale could be used in making a sketch of the solar system? Questions like these can begin discussions and investigations about appropriate scales. You might like to include the bulletin board idea from *Choose the Scale* at this time. The bulletin board becomes part of an investigation into appropriate scales when the students are asked to match scales to representations.

The relationships of linear dimensions with area and volume are of major concern to the Lilliputians in *Gulliver's Travels*. Gulliver is 12 times as tall as the Lilliputians or a 12 to 1 enlargement. The student activity *Life in Lilliput* contains some interesting questions which show some of the problems the Lilliputians had in taking care of Gulliver. Making sheets, blankets and clothing for Gulliver involves the relationship between linear dimensions and area. Feeding Gulliver involves the relationship between linear dimensions and volume.

MAKING A SCALE DRAWING

Students have already made many 1:1 scale drawings. Common examples are tracing the outline of a hand or figure, or making fingerprints which are mirror 1:1 scale representations of the patterns on fingertips. Usually the scale drawings we want to make are enlargements or reductions. A 2:1 enlargement means that each linear measurement on the scale drawing will be twice as long as the corresponding linear measurement on the original. A 1:2 reduction will have linear measurements one-half the corresponding measurements on the original.

Snapshots, television shows, and billboards are examples of scale representations. Most of these are made with the aid of cameras, projectors and other technical devices, but there are several useful methods for making scale drawings by hand. These methods are discussed below.

Using Grids to Make Scale Drawings

Grids can be used to make scale drawings in several ways. Since each of these ways involves transferring a design from one grid to another, some practice in copying designs is helpful. The student page *Border Designs* asks students to continue geometric patterns with a 1:1 scale. These same patterns could later be enlarged or reduced in size.

A BORDER DESIGN

The grid of nails on a geoboard can be the basis for a rubber band pattern. This pattern can be transferred onto a paper grid of dots where each dot on the page represents a nail on the geoboard. The dot grid can be any size. If it is smaller than the geoboard, the scale drawing will be a reduction. The butterfly shown at the left is a reduction of a geoboard design. Any two nails which are joined by a rubber band on the geoboard are represented by two dots joined by a line segment. In both of the activities *Border Designs* and *Geoboard Designs* students are involved in counting squares or dots, finding corresponding points and checking to see that their scale drawings really look proportional to the originals.

A GEOBOARD DESIGN

To make an enlargement or reduction to a specific scale, place the original design on a grid of squares. To enlarge the design to a scale of 2:1, make a grid with squares twice as long and wide. Copy the design one square at a time onto the new grid. To make a 1:2 reduction, make a grid with squares half as long and wide. Copy the design. The classroom pages *I Have Designs on You*, *Grid Graphs*, and *Paint Your Wagon* use these ideas with grids. Sometimes it is helpful to number the lines of the grid as shown in *Grid Graphs*.

ORIGINAL

2:1 ENLARGEMENT

1:2 REDUCTION

ORIGINAL

1:2 REDUCTION

3:1 ENLARGEMENT

Another way to make a grid enlargement is to use the same size grid for the scale drawing as for the original. For a 3:1 enlargement the edge of one square on the original will correspond to the edge of 3 squares on the enlargement. Notice on the scale drawings at the left that the circle on the original occupies one square, but on the 3:1 enlargement it occupies 3^2 or 9 squares and on the 1:2 reduction it occupies $(\frac{1}{2})^2$ or $\frac{1}{4}$ squares. The student page *The Parthenon* has students make a 1:3 reduction using the same size grid paper. Your students can probably draw other designs to enlarge or shrink.

Students who have enjoyed making scale drawings in two dimensions might like to try scale drawings of three-dimensional objects. Isometric grids

are useful for three-dimensional scale drawings. The edges of the figure at the right are not on the grid lines themselves, but they do connect vertices of the grid. To draw a 2:1 enlargement of this figure, count the horizontal and vertical spaces for each edge of the figure and double these lengths on an isometric grid.

Using a Ruler to Make Scale Drawings

Perhaps you have seen a triangular ruler like the one shown here. Rulers like this are used by architects and engineers for scaling. There is a pattern for making an architect's ruler on the student page *Archie Texs' Ruler*. The page can be run on tagboard to make a sturdy ruler. The students are asked to complete the six number lines according to the given scales as shown at the right.

ISOMETRIC
GRIDS

(PATTERN)

2:1 ENLARGEMENT

ORIGINAL

ORIGINAL

1:3 REDUCTION

Enlargement To make a 2:1

enlargement, measure each side of the original using the 1:1 scale, then reproduce the figure using the 2:1 scale. Notice that the units change when making the scale drawing, but the number of units read on the ruler stays the same.

Reduction To make a 1:3 reduc-

tion, measure each side of the original using the 3:1 scale and then reproduce the figure using the 1:1 scale.

Combinations of these scales can be used. For example, for a 3:2 enlargement first reproduce the original figure by a 3:1 enlargement and then reproduce the resulting second figure by a 1:2 reduction.

Architect's rulers are useful, but most of our measuring is done with common inch or metric rulers. Using a ruler with one number line to make a scale drawing involves a different process than using the architect's ruler which has several number lines.

To make a 2:1 enlargement with a centimetre ruler, the number of units for each linear measurement must be doubled. 2 cm $\rightarrow$ 4 cm, 5 cm $\rightarrow$ 10 cm, ... In other words, the units stay the same, but the number of units changes.

The rectangle at the right has width 3 cm. To make a $1\frac{1}{2}:1$ enlargement, each centimetre in the original must be stretched to $1\frac{1}{2}$ centimetres in the enlargement. This is equivalent to multiplying each linear measurement by $1\frac{1}{2}$. For the 2:3 reduction 3 centimetres on the original is shrunk to 2 centimetres in the reduction. This is equivalent to multiplying each length by $\frac{2}{3}$.

ORIGINAL

 $1\frac{1}{2}$ ENLARGEMENT

2:3 REDUCTION

LINE DESIGN

The ability to enlarge with a ruler is useful for making home decorations. The geometric design at the left is the basis for an elaborate line design. To make a wall-size line design, the geometric pattern must be enlarged to the desired size. Nails or holes are spaced at equal distances along all the edges. The design is then sewn or wrapped with thread. To enlarge this design with a ruler, the basic geometric shapes must be identified and scaling techniques applied. You can find patterns for line designs in Line Designs by Dale Seymour.

The classroom pages in this resource which involve making scale drawings using a ruler are *A Pen for Your Pencil*, *Take Me Out to the Ball Game*, *Use Metres in Your Yard* and *Plato and the Solids*.

Using Projection Points
to Make Scale Drawings

The Renaissance painters were interested in depicting the natural world. The specific problem they coped with was that of painting three-dimensional scenes on canvas. The solution was the creation of a new system of mathematical perspective. The most influential of the artists who wrote on perspective was Albrecht Durer.

Durer thought of the artist's canvas as a glass window through which the scene to be painted is viewed. From one fixed point lines of sight are imagined to go through the artist's canvas to each point of the scene. This set of lines is called a projection. This method is illustrated by the picture shown above.

Durer's method is very handy for reproducing figures for a given scale factor. In the figure shown to the right, triangle $A'B'C'$ is a 2:1 enlargement of triangle ABC . To obtain this enlargement, the points A , B and C are projected (pushed out) from projection point P so that the points A' , B' and C' are twice as far from point P as the corresponding points A , B and C . By this method the sides of $\triangle A'B'C'$ are reproduced twice as long as the sides of $\triangle ABC$.

Surprisingly, it does not matter where the projection point is placed. If we place the projection point P inside $\triangle ABC$ as shown at the left and then project the points A , B and C out twice as far from P , we again obtain a reproduction which is a 2:1 enlargement.

The scale factor for a projection may be a fraction or a negative number. A scale factor of -2 has been used here to enlarge the smaller flag. For a negative scale factor the original figure and its reproduction will be on opposite sides of the projection point. For example, Y' is twice as far from the projection point P as Y , but in the opposite direction.

PINHOLE CAMERA

The lenses of our eyes and of cameras invert the images of scenes much like a projection with a negative scale factor. The scene is reproduced upside down on the retinas of our eyes and on the film of a camera. Your class might like to make a pinhole camera. You can find plans for such a camera in World Book Encyclopedia. The following student pages use perspective points to make scale drawings: *What's the Point*, *Bigger Than Life*, *A Shrink*, *A Negative Feeling* and *Projecting Through the Pinhole*.

Using a Pantograph to Make Scale Drawings

A pantograph is a mechanical device for enlarging and reducing figures. It can be easily constructed from four strips of cardboard or from an erector set. (See the student page *The Pantograph*.) These four strips are connected so the strips move freely. Point P acts like the projection point and should be held fixed. As point D is placed over each vertex of a polygon, a pencil at point A can be used to mark each vertex of the enlargement.

As the new points are found, the ratio $PA:PD$ remains the same. In the picture above PA is twice as long as PD , so the scale factor is 2. In order to use the pantograph for a reduction, the pencil should be placed at point D , and point A should be placed over various points of the original.

The pantograph on the student pages has just one set of holes for enlargements with a scale factor of two. There are several holes in the arms of the pantograph shown below to allow for different ratios of PA to PD. The following illustrations show two more settings of the pantograph.

As the pantograph is changed so that D moves closer to P, the ratio $\overline{PA}:\overline{PD}$ gets larger. In this illustration the scale factor is 4.

As D moves farther from P, the ratio $\overline{PA}:\overline{PD}$ gets smaller. In this illustration the scale factor is $\frac{4}{3}$.

Pantographs are not always made out of rigid material. Your students might enjoy using the rubber band pantograph described in *A Snappy Solution to Scale Drawings*.

Using Indirect Measurement to Make Scale Drawings

Often we cannot measure distances directly--can you imagine a tape measure stretching to the sun? The heights of trees, buildings, mountains, etc. can be determined from scale drawings which are reductions of the actual scene. The Greeks created and applied methods of indirect measurement. They found the circumferences of the earth, moon and sun and computed the distances to the moon and the sun. Such things, which at first seem incredible, can be accomplished with only a knowledge of scales and proportions.

By Permission of John Hart and Field Enterprises, Inc.

Measuring with Shadows: The use of a stick and its shadow to measure the heights of objects is very old. As long ago as 600 B.C. the Greek mathematician Thales (thā'lēz) used this method to measure the heights of pyramids. The method is simple and uses proportions. Suppose a stick of height 4 metres is held perpendicular to the ground and has a shadow of length 3 metres. Then the ratio of height to length is 4:3. If the length of the tree's shadow is 24 metres, then the height of the tree can be found by solving the following proportion.

$$\frac{x}{24} = \frac{4}{3}$$

Measuring with a Hypsometer: The hypsometer is a simplified version of the quadrant, an important instrument in the Middle Ages, and the sextant, an instrument for locating the positions of ships. The grid on the hypsometer is used to set up a scale. For example, if you are 55 metres from the base of an object, this distance can be located on the right-hand side of the hypsometer by representing ten metres as one unit on the edge of the grid. Following the dotted line on this hypsometer to the string of the plumb line and then down to the lower edge of the grid shows that the height of the object above eye level is 25 metres. The units on the grid may represent feet, yards, centimetres, metres or any other convenient measure.

HOMEMADE HYPSONETER

A common mistake in using the hypsometer is forgetting to add the distance from the ground up to eye level. For the position of the hypsometer which is shown above, the height of the wall from A to B in the following diagram is 25 metres. To get the total height of the wall, the distance of the eye above the ground must be added to 25 metres. For activities with the hypsometer see the student pages *How to Make a Hypsometer* and *Using the Hypsometer*.

Using a Plane Table to Make a Scale Drawing

A plane table is one of the simplest ways of making a scale drawing of a small region, such as a room, backyard or field. With this device it is unnecessary to measure the angles or distances between objects. Only one distance needs to be known. The following series of pictures show the plane table being used to map the location of objects onto a piece of paper. In the second picture the line $\overline{PQ}$ has been represented on the paper by the line $\overline{P'Q'}$. The use of a plane table is illustrated on the student page *Stake Your Claim*.

Using a Transit to Make Scale Drawings

When making a scale drawing of a geographic area, it is often necessary to know the angles formed by imaginary lines joining trees, buildings and other landmarks. The transit is an important instrument for measuring horizontal and vertical angles in civil engineering. Like the early transit, the homemade transit shown here and developed on the student page *Another Stake Out* is capable of measuring only horizontal angles.

HOMEMADE TRANSIT

Suppose we wish to find the distance between points Q and T shown in the diagram below. If we had a scale drawing of the area, we could easily determine the distance. A stake can be placed at point Q and another stake placed at an arbitrary point P. The distance from P to Q is measured. The transit is used to measure the angles P and Q of the triangle PTQ. In each case the metre stick part of the transit should be held parallel to the line through stakes P and Q.

In the classroom a scale drawing of the triangle can be drawn on paper with angles P' and Q' equal to angles P and Q, respectively. The length of $\overline{P'Q'}$ can be chosen conveniently to set up a scale between the lengths of $\overline{PQ}$ and $\overline{P'Q'}$. For example, 1 centimetre might represent 10 metres. Since $\overline{Q'T'}$ is 5 cm long, $\overline{QT}$ has length 50 m.

SUPPLEMENTARY IDEAS IN SCALING

Scale drawings and maps are common topics in scaling, but there are many other scaling activities which involve important mathematical content. Students might use a given scale to make a dip stick (see *Make a Dip Stick*) for measuring the volume of irregular containers. The effect of different scales on graphs can be tested (see *The Gee Whiz Graph*). These and other topics in scaling are developed in the classroom materials in this section.

Many of the student pages in this section are devoted to 3-dimensional scaling. One of the simplest ways of introducing scaling in three dimensions is through the use of cubes or building blocks. The larger of the two figures shown here is a 2:1 enlargement of the smaller figure. This means that the length, width and height of the larger figure are each twice as long as the length, width and height of the smaller figure.

ORIGINAL

2:1 ENLARGEMENT

Some Classroom Activities

a. Build some skyscrapers out of cubes. Set up a scale and pose some questions. For example, if the edge of a cube represents 15 feet, how long is the building on Main Street? For similar questions see the student pages *Scaling a Skyscraper* and *Building a Skyscraper*.

ORIGINAL

2:1 ENLARGEMENT

A 2:1 enlargement can also mean that each cube or building block is to be replaced by a 2:1 enlargement. In this case, the 2:1 enlargement of the smaller figure would have bigger cubes.

Since different size cubes are normally not available, enlargements with the same size cubes are used in the following illustrations and on the student pages.

b. Build a box-shaped figure of cubes and then build an enlargement for some given scale factor. For a 2:1 enlargement, as shown here, each linear dimension of the original figure is doubled.

c. Build some irregular figures, such as the one shown here, and then build a 2:1 enlargement. This activity is much more difficult than enlarging box-shaped figures as in Activity #2 and will probably generate discussions.

Scales, Area and Volume

Imagine meeting the Terex Titan on a highway. This truck is so wide that it would require three regular road lanes. It is 4.6 times larger and 4.8 times wider than the Chevrolet Luv pickup which is shown on its dumpbox. Needless-to-say, the Terex Titan does not cost just 4.8 times more than the Chevrolet pickup nor is its capacity only 4.8 times greater.

World's biggest Tonka Toy

General Motors has unveiled the world's largest truck, this 67-foot-long Terex Titan. The off-highway hauler is 25 feet wide and can carry more than 350 tons, GM says. The truck is scheduled to undergo a minimum of 12 months of testing at a mining site in southern California. For size comparison, that's a Chevrolet Luv pickup on the Titan's bed.

The relationships between scale enlargements and the increase in area and volume can be discovered by your students through the use of cubes or building blocks as suggested in the above activities. These relationships are discussed in the following paragraphs.

Area. If we refer to the figures shown here as buildings and the faces of the cubes as windows, the area of each side of the smaller building can be compared to the area of the corresponding side of the larger building in terms of windows. For example, there are four times as many windows on each side of the larger building. By varying the scale factors and comparing areas, your students will be able to see that the area of the enlargement is always the product of the square of the scale factor and the area of the original figure.

Volume. In the enlargement activities suggested on the previous page your students will quickly discover that if the original figure has too many cubes, they may not have enough cubes for the enlargement. For the 2:1 enlargement shown here there are 8 times as many cubes in the large building as in the smaller one. By varying the scale factors and comparing the numbers of cubes needed in a building and its enlargement, your students will become acquainted with the fact that the volume of the enlargement is always the product of the cube of the scale factor and the volume of the original figure.

The relationships of linear dimensions with area and volume are responsible for governing the sizes of living things. For example, it would be impossible for a fly to be the size of a horse, or a rabbit to be the size of a hippopotamus. For an interesting discussion on this topic read "On Being the Right Size" by J.B.S. Haldane. This essay can be found in Readings in Mathematics, Volume 2, edited by Irving Adler, Ginn and Co. or in The World of Mathematics, Volume 2, edited by James R. Newman, Simon and Schuster.

MAPS

Maps have been indispensable since the beginning of recorded time. The first maps may have been directions drawn on the ground. Today there are many types of maps which represent the earth's surface and parts of this surface. There are maps of towns, states, regions and countries, all of which can be easily obtained for use in the classroom. Maps show the relative locations of objects, and it is the lack of objects which is causing the difficulty for the cartoon character at the right.

Scales on maps are often indicated by a line segment and the distance which the line segment represents. Here is an example which was taken from an American Automobile Association map of Western United States. The five small spaces to the left of 0 can be used for smaller subdivisions of the 20-unit intervals.

Scale in Miles

Scale in Kilometres

One inch represents approximately 40 miles or 64 kilometres.

Since scales are ratios, it is common to see scales written in the following two ways.

1 inch to 40 miles or 1 inch : 40 miles

While the use of equality, such as 1 inch = 40 miles, is mathematically incorrect, it is frequently found on maps. Students will need to realize that 1 inch on the map represents 40 miles on the corresponding geographic region.

Local, state and regional maps are available for classroom use. The mileage to various points of interest can be computed along with the travel costs to such points. The bus, train or automobile costs can be approximated, including gas, oil and tolls. The scales on different maps can be compared. What happens to scales for larger and larger regions of the earth? Most of the student pages on maps contain examples and questions for developing and reading maps.

A source for contour maps is given on the student page *Scaling a Mountain*. You could obtain some contour maps of your region and have your students find the highest and lowest points of elevation. All the points which have a given elevation are shown with a contour line. For example, the points with 150-foot elevation on the contour map shown here are on the heavy line.

Your students might enjoy making a map of an area of their own choice. They can measure the distance to each landmark by counting blocks, paces or turns of a trundle wheel. A homemade transit can be used to measure angles between objects and a convenient scale chosen to fit the map onto paper. Some students might like to make a treasure map and have other classmates use the map to find the treasure.

WHAT AM I?

Identifying by Outlines
Getting Started
SCALING

TEACHER DIRECTED ACTIVITY

Show outlines of small objects on the overhead projector. Ask students to identify the objects from the outline representations. Some objects are easy to identify while others are ambiguous, e.g., common shapes like circles or rectangles. Ask students how the drawings might be altered to remove the ambiguities. (3-dimensional drawings or even a 2-dimensional drawing if a few details are drawn in will help the situation.) The overlay could be used to motivate a need for 3-dimensional drawings.

Extensions: 1) Have students select small objects in the room and trace them on paper. Ideas to consider: a) Why are some objects hard to trace? b) Which characteristics of the objects are represented by the drawings? Have students pair up, exchange drawings and try to identify the objects.

2) Have students trace several attribute blocks on paper. Is the outline enough to identify the block? What other drawing could the student make to tell more about the block's appearance?

PERFECT FIT

Project:

Have a student bring in a clothing pattern to be displayed on the bulletin board. The actual pattern, the cutting layouts, and the pattern package should all be displayed. A background of actual fabric would be attractive. The bulletin board display could serve as an emphasis and motivation for several concepts.

1. The pattern is a 1:1 scale drawing of the pieces needed to construct the garment and also is a scale drawing of the size of the garment needed to fit a particular person.

2. The pattern package shows the amount of material needed for the garment according to the size and to the width of the material.

3. The cutting layout is a representation (scale drawing) showing how the pattern should be laid out on the material.

4. A lab activity could be developed where students actually lay out a pattern on material. This could show a student how the left and right sides of garments are cut (also, how to eliminate a seam by laying out the material along the fold). If several widths of material are available, the student can see how the arrangement of the pattern is changed to waste the least amount of material.

TYPE: Bulletin board/Activity

Three-dimensional models such as cars, airplanes, The Transparent Woman, and/or The Transparent Man along with the instructions for assembling the models could be displayed to show other examples of scaling.

BUG OFF!

Motivation
Scales as Ratios
Getting Started
SCALING

E
S
I

1. The same size as the object.

Scale of 1:1

A scale is usually a comparison of linear measures. Thus, a scale of 2:1 implies the grasshopper is twice as long and twice as high. (The area of the two drawings would be in a ratio of 4:1 and the volume of two 3-dimensional grasshoppers would be in a ratio of 8:1.)

2. Smaller than the object.

Scale of 1:2

3. Larger than the object.

Scale of 2:1

All three drawings are scale drawings. The scale below each drawing tells how the lengths in the drawing compare with the lengths of the actual object.

Ideas for class discussion:

- 1) Explain the scale in picture #2, #3.
- 2) Why do we have scale drawings?
 - a) Where would we find reductions (pictures like #2)?
 - b) What is their advantage?
 - c) Where would we find enlargements?
 - d) What is their use?

- 3) Compile a list of objects. Which objects could be drawn in reduced, enlarged or actual size on a sheet of notebook paper?
- 4) Have you ever made or used a scale drawing? (Model toys or clothing patterns.)
- 5) Make a bulletin board of pictures. Are the pictures enlargements, reductions or actual sizes?

YOUR MOD BOB

Using Scales to Represent
Heights
Getting Started
SCALING

E
S
1

Materials needed: Long piece of string, scissors, name label, stapler or thumbtack.

Activity:

- (1) Have a classmate measure your height with a piece of string.
- (2) Cut the string to represent your height.
- (3) Fold the string into two equal pieces and cut.
- (4) Attach one piece of the string to the bulletin board. Label it with your name.
- (5) Save the other piece of string.

When all of your classmates have placed their strings on the bulletin board, you will have a scale representation of everyone's height.

If at this introductory level you wish to talk about the scale, it is a scale of 1:2. That is, 1 unit of string (scale) represents 2 units of string (height of the student).

- (6) Use the other piece of string; fold it into equal pieces to make a scale representation of your height that will fit on the piece of paper on the bulletin board. How many times did you fold the string?
- (7) How are the two scale representations different? How are they the same?

- (8) Use another piece of string for measuring and draw a scale representation of yourself that will fit lengthwise on a piece of notebook paper.

The instructions for this activity are purposely open-ended to encourage problem solving.

Extension: Using this same idea a scale representation of the heights of several items in the classroom could be made. The students could then try to match the item to the representation.

WHAT SCALE?

Determining the Scale
Getting Started
SCALING

Scale of ____: ____

Scale of ____: ____

Scale of ____: ____

Scale of ____: ____

For these:

- ① use a transparent grid, or
- ② trace on grid paper, or
- ③ measure with a ruler.

Scale of ____: ____

Scale of ____: ____

Extension: Using a transparent grid have students measure two sizes of their class photographs and find the scale of enlargement. Have students measure the fronts of two different sized containers of the same product to find the scale of enlargement. Is the writing on the containers to the same scale? Compare the volumes of the containers. Is the ratio of the volumes the same as the scale of the containers?

1776-1976

Determining a Scale
Getting Started
SCALING

Measure to the nearest centimetre and record the information in the table.

Compare each measurement in the enlargement to the same measurement in the original. Express each pair as a ratio, enlargement : original.

	length of dog house	length of Snoopy's ear	length of flagstaff	width of 1776 flag	length of 1776 flag
enlargement					
original					

____:____, ____:____, ____:____, ____:____, ____:____.

Each ratio can be simplified to ____:____. The enlargement is a scale drawing with a scale of ____:____.

Use the scale to help you draw the missing flag in the enlargement.

Extension:

- 1) In *Mathematics*, Life Science Library, page 122, have students measure the same parts on each reflection to determine the scale of reduction.
- 2) Have students bring two sizes of their school pictures. By measuring have them determine the scale.
- 3) If school pictures are not available, have students bring any photograph of themselves and find the scale of reduction using actual body measurements.

SCALY

Choosing an Appropriate
Scale
Getting Started
SCALING

Materials: Game board
Marker for each
player
Die

GB means
Go Back to
the start.

Rules:

- 1) Players each roll the die. Largest number goes first.
- 2) Scales:
 - a) 2 spaces for each dot on the die
 - b) 3 spaces for each dot on the die
 - c) 4 spaces for each dot on the die
- 3) Players roll the die, choose a scale to avoid the Go Back spaces, and move their markers forward.
For example, if a player rolls a 5 on the die, and the 3:1 and 4:1 scales both would move him to a Go Back space, he would choose the 2:1 scale and move 10 spaces forward.
- 4) If all scales move a player beyond Scaly's eye, the player loses his turn.
- 5) The first player to exactly reach Scaly's eye is the winner.

Variations:

- 1) If a 3 is rolled the move must be made backwards.
- 2) Have each player choose a scale at the beginning and use it for the entire game. Does this affect the winner?
- 3) Two dice could be rolled, converted to moves, and then the difference between the two is the number of spaces to be moved.

BEANS, BEANS

Using a Scale to
Make Predictions
Getting Started
SCALING

This is an activity that uses scaling to obtain information and make predictions.

Materials: Two 1-gallon jars (same shape)
One jar is to be filled with beans and sealed
A dowel rod to calibrate a scale for the empty jar
A supply of extra beans
A team of 3 students

Activity:

- (1) Each student should make and record an individual guess of the number of beans in the jar.
- (2) Make a team guess. It may be the same as or different from the individual guesses. Discussing the guess should give a good approximation of the number of beans in the jar.
- (3) Place the dowel rod next to the jar and mark the rod to show the top of the jar.
- (4) Mark the rod into several equal parts. 10 or 20 marks would be convenient. Your scale is _____ lengths : 1 jar.
- (5) Place the rod in the empty jar and add beans to the first mark. Count the beans. What is your scale? 1 length : _____ beans. Repeat this three more times to get an average number of beans. Scale of 1 length : _____ beans.
- (6) Use the scale to predict the number of beans in the sealed jar.
- (7) How close to the prediction was each individual guess?
- (8) How accurate was your team guess?

Before beginning this activity, have students develop their own method for determining the number of beans in the jar.

TYPE: Activity

A PICTURE'S WORTH 1000 WORDS

Converting Measurements
Using a Scale
Getting Started
SCALING

The dictionary uses pictures to illustrate its definitions. Sometimes a scale is given near the picture to indicate the size of the picture compared to the real thing.

Measure each picture in mm or cm and use the scale to figure the size of the real thing. Choose your answer from the bottom of the page by taking the measure closest to your answer.

Puffin Scale of 1:10

(a) A puffin is _____ cm.

Sea Horse Scale of 1:4

(b) A sea horse is _____ mm.

Cockroach Scale of 1:2

(c) A cockroach is _____ cm.

Antelope Scale of 1:50

(d) An antelope is _____ m.

Whale Scale of 1:300

(e) A whale is _____ m.

Dinosaur Scale of 1:250

(f) A dinosaur is _____ m.

Albatross Scale of 1:35

(g) An albatross is _____ cm.

98, 30, 100, 12, 3.0, 15, 1.25

◀ CLASSY CALENDAR ▶

TEACHER DIRECTED ACTIVITY

Determining and Converting
a Scale
Getting Started
SCALING

On the bulletin board arrange colored strips of paper to represent the twelve months of the year. The color of each strip could correspond to the color of the birthstone for that month, and the length of each strip should be proportional to the number of days in the month. Select a scale that is suitable for the size of the bulletin board, e.g., 1 day represents 5 centimetres.

	... January - garnet - deep red
	... February - amethyst - lavender
	... March - aquamarine - sky blue
	... April - diamond - white
	... May - emerald - green
	... June - alexandrite - purple
	... July - ruby - red
	... August - peridot - yellowish - green
	... September - sapphire - dark blue
	... October - tourmaline - pink
	... November - topaz - yellow
	... December - turquoise - blue

- (1) Have a couple of students measure the strips and determine the scale used.
- (2) Each student should then use the scale to locate his birthday on a strip. After each has colored in his birthday, these questions could be asked.
 - (a) Which month is the most popular month for birthdays? Least popular?
 - (b) Number of birthdays in a month : Total number of students?
 - (c) Number of birthdays in 1st half of year : Number of birthdays in 2nd half of year?
 - (d) Number of boys having a birthday in a month : Number of girls having birthdays in the same month?
 - (e) Number of months with 31 days : Number of months with 30 days?
 - (f) Number of months starting with the same letter of the alphabet : Total number of months?
- (3) Vacation times, weekends and/or holidays could be colored in on the strips. Special events, such as the World Series, state fairs or Mardi Gras, could also be shown.
- (4) Specify a scale, e.g., 1 cm represents 1 day and have students draw a model of the bulletin board calendar on their papers. Have them locate their birthdays and the birthdays of those in their families. Holidays and days of special importance to each student could also be marked.

SCALE OF 1 in.:1 ft.

1. In Gulliver's Travels by Jonathan Swift Gulliver was shipwrecked on an island called Lilliput. The Lilliputians were very, very small.

Look at the sketch. How tall is Gulliver drawn here?

How many Lilliputian men fit alongside him?

How tall does this make each one on the drawing?

Look at the scale. What is:

Gulliver's real height? _____

a Lilliputian's real height? _____

2. Swift used this scale as a rough guide to convert our sizes to Lilliputian. Measure these parts on your body. Convert the measurement to Lilliputian.

	your actual measurement	Lilliputian measurement
a) height	_____	_____
b) length of foot	_____	_____
c) length of leg	_____	_____
d) width of shoulders	_____	_____

3. Since Gulliver was so large, the Lilliputians used this rhyme to help them measure him:

"Twice round my thumb, once round my wrist,
Twice round my wrist, once round my neck,
Twice round my neck, once round my waist."

- a) Which parts of the body are in a 2 to 1 ratio?
- b) Measure your thumb. Use the 2 to 1 ratio to find what your neck and waist measure. Check by measuring them. Is the rhyme practical?
- c) Test the rhyme on your parents.

LIFE IN LILLIPUT (CONTINUED)

1. The Lilliputians decided to make Gulliver a bed with sheets and blankets. How many Lilliputian blankets were needed to make a blanket for Gulliver. Use the sketch to help you.

2. Three hundred tailors were employed to make clothes for Gulliver. If the suits they made were the same thickness as their own, how many times as much material did the tailors need?
3. Suppose the Lilliputians made a bathtub for Gulliver. If the scale is the same, how many Lilliputian tubs would fit into Gulliver's tub?

If the linear ratio is 1:12, the volume ratio will be 1:1728.

4. How many times as much food did Gulliver need as the average Lilliputian?

Have a copy of Gulliver's Travels available.

"On Being the Right Size" by J.B.S. Haldane is an essay about many interesting properties of living organisms and how the ratio of surface area to volume affects heat loss, mobility, food needs, etc. The essay can be found in Readings

in Mathematics, Volume 2, edited by Irving Adler, Ginn and Co. or in The World of Mathematics, Volume 2, edited by James K. Newman.

Getting Started
SCALING

Scale of 1cm : 50,000

Facts from One Million

Using the scale of 1 cm : 50,000 items, estimate the number of centimetres needed to show each statement. Check your estimate by placing the number in each statement along the scale.

- A. There are 301,121 people named Nelson in the United States. _____ cm
- B. It takes 625,000 separate bee-to-flower trips to produce $\frac{1}{4}$ of a pound of honey. _____ cm
- C. If you were a codfish, the odds against dying a natural death are 974,731 to one. _____ cm
- D. 226,512 pounds is the weight of one inch of rainfall over one acre of land. _____ cm
- E. 25,603 days is the average life expectancy in the United States. _____ cm
- F. There are 706,000 different types of plants on the earth _____ cm
- G. The world's largest airplane, the C-5 Galaxy, weighs 497,000 pounds. _____ cm
- H. There are 112,152 dentists in the United States. _____ cm
- I. It takes 558,000 gallons of water to produce one ton of alfalfa. _____ cm
- J. The sun has a diameter of 864,000 miles. _____ cm

This activity could make a nice bulletin board. Students could enlarge the scale and write additional facts on the scale.

TYPE: Paper & Pencil/Bulletin Board

CHOOSE THE SCALE

Choosing a Reasonable
Scale
Getting Started
SCALING

TEACHER PAGE

A bulletin board display could give students practice in associating reasonable scales with pictures or scale drawings. Pictures from magazines, maps, xerox copies from textbooks, etc. could be attractively arranged on the bulletin board, and the corresponding scales posted separately. String could be used for students to match each scale with the corresponding graphic or the scales could be moved and placed next to the appropriate graphic. For several days discussions and changes on the bulletin board should be entirely student-centered. To close the activity the teacher could have a class discussion of the final choices. Thus, the bulletin board can be used as an active learning tool.

TYPE: Bulletin Board/Activity

HAVE YOU GOT SPLIT ENDS?

Using a Microscope
to Enlarge
Getting Started
SCALING

Materials: Microscope
Several slides of small objects
Ruler

Activity:

- 1) Guess (in millimetres) the width of a hair from your head.
- 2) Pull out a hair and try to measure it with the ruler.

- 3) Place the hair on the stage of the microscope. What scale enlargements can you see under the microscope? The numbers are usually written on the lenses.

a) ____:____ b) ____:____ c) ____:____.

- 4) Compare the width of your hair with a hair from another person with a different color of hair. Is one color of hair wider than the other? If so, which color is the widest?

- 5) Compare the widths of a curly hair and a straight hair. Is there a difference?

- 6) If you have other slides, compare the width of your hair with the width of the other objects. In each case which is wider?

- 7) This picture shows the width of a hair drawn to a scale of 600:1. If this hair is 45 mm wide, how wide is the actual hair?

- 8) Using the same scale, about how long are each of the other objects on the picture above?

- a) Pollen
- b) Spore
- c) Water
- d) Bacteria

GEOBOARD DESIGNS

Copying Designs
Making a Scale Drawing
SCALING

This worksheet is a readiness activity for scale drawings. The student creates a design on the geoboard and then makes a scale drawing on the dot paper. A master for the dot paper can be found following *Geoboard Percents* in the section PERCENT: Conversion.

Use only 4 or 5 rubber bands on the geoboard.

- 1) Make each design on your geoboard.

a.

b.

c.

- 2) Make a design of your own on the geoboard. Copy your design on dot paper.
- 3) Make a stop sign on the geoboard. Copy the sign on dot paper.
- 4) Make the largest number you can on the geoboard. Copy the number on dot paper.
- 5) Make your name on the geoboard. Copy each letter on dot paper.
- 6) Make a house, a boat or an airplane on the geoboard. Copy each design on dot paper.
- 7) Make a triangle on the geoboard. Copy the triangle on dot paper. Is your triangle the same as your neighbor's? How many different triangles do you think you could make?

TYPE: Activity

As a class demonstration you could exhibit a design on your geoboard and have students copy it on theirs.

BORDER DESIGNS

Copying Designs
Making a Scale Drawing
SCALING

This worksheet serves as a readiness activity for grid enlargements and reductions. The students create designs by copying a pattern. The scale for each drawing is 1:1.

Continue these border designs. You could use colored pencils.

Create a design of your own. Repeat the pattern.

This activity can be done by projecting grid designs (some easy, some difficult) for students to copy on grid paper.

TYPE: Paper & Pencil

I HAVE DESIGNS ON YOU

Enlarging/Reducing with
Grids
Making a Scale Drawing
SCALING

1. Copy the design on the grid below. The scale is 1:1.

2. Make an enlarged copy of the design that fills the grid below. On the enlargement the scale is 2:1. That is, 2 lengths on the enlargement represents 1 length on the original.

3. Make a reduced copy of the design on the grid below. On the reduction the scale is 1:2.

For the enlargement every other line could be darkened, and for the reduction a line between each pair of lines could be drawn.

4. Make a design of your own on graph paper. Have a friend make a 2 to 1 enlargement of the design.

TYPE: Paper & Pencil

THE PARTHENON

Reducing with Grids
Making a Scale Drawing
SCALING

Use the $\frac{1}{2}$ -centimetre grid provided to make a scale drawing of the Parthenon below. Reduce the dimensions of the drawing to one-third their present length. Look for shortcuts.

TYPE: Paper & Pencil

GRID GRAPHS

Reducing with
Grid
Making a
Scale Drawing

TEACHER DIRECTED ACTIVITY

How to make grid graphs and distorted graphs:

Ask students to bring comic books, newspaper comic strips, Mad magazines, and picture magazines for use in the classroom. The school library often has old copies of newspapers and magazines. Used-book stores are another source of such materials.

Let students choose a cartoon character, a comic strip character, a real life photograph, or a real life drawing. The first pictures should be simple.

Instruct them to make an enlargement, a reduction, and/or a distortion of the picture they select.

STEPS TO FOLLOW:

- Cut out the picture.
- Using a ruler and a pencil, draw a grid over the picture.
Make the squares a standard size (i.e., square centimetres, square inches, square half-centimetres--whatever seems the most appropriate size.)
- Use graph paper sizes provided, or create your own grids to enlarge, reduce, and/or distort the picture.

- The following grids show various distortions of the original figure. Students can use these illustrations for ideas. Students could draw an original distorted grid and give it to another student to complete. These scaling assignments make a nice bulletin board display.

TYPE: Activity
IDEA FROM: Art 'N' Math

GRID GRAPHS

PAIN'T YOUR WAGON

Enlarging with Grids
Making a Scale Drawing
SCALING

Below are instructions for making a wagon.
Make a wagon twice as long and twice as wide.

A. The Body

1. Copy this shape on squared paper. Count the spaces you need for each line.
2. Cut on the heavy solid lines.
3. Fold along the dotted lines.
4. Use the square flaps to fasten the body together.

B. The Wheels

1. Use a poker chip, 50¢ piece, or small lid. Place it on an index card and draw around it.
2. Cut out the circle.
3. Make three more wheels like this.
4. To find the center of each wheel, draw another circle, cut it out, and fold it in half. Open it out and fold it again in a different place. Open it out. The center of the circle is where the fold lines cross. Fit the circle on each of your wheels and use a pin to make a hole through the center.

C. The Axles

1. Use squared paper to mark out two strips of index card, each 12 spaces long and 1 space wide. Cut out the strips.
2. At each end mark off one square.
3. Find the center of each square by drawing the diagonals. Make a small hole at each center.
4. Bend down the end squares.
5. Turn the body of the wagon upside down and stick the axles to it.
6. Put a pin through the center of each wheel and fasten the wheels to the axles. You may need to tape the pins to the bottom of the wagon to keep the wheels from coming off.

TYPE: Activity
IDEA FROM: New Oxford Junior
Mathematics, Book 1

PACE OUT THE SPACE

Reducing with a Grid
or Ruler
Making a Scale Drawing
SCALING

- 1) Count the number of paces needed to pace
 - _____ a) the length of the room.
 - _____ b) the width of the room.
 - _____ c) the length of the black boards.
 - _____ d) the length of the heating units.
 - _____ e) the length of the teacher's desk.
 - _____ f) the width of the door.
 - _____ g) the distance from the corner of the room to the door.
 - _____ h) the width of the windows.
 - _____ i) the width of other prominent objects in your classroom such as large tables, bookshelves, or filing cabinets.

- 2) On a piece of grid paper using a scale of 1 unit of length : 1 pace or on a piece of plain paper using a scale of 1 cm: 1 pace, make a scale drawing of your classroom. Include the arrangement of the desks by pacing the distance the 1st desk is from the front and side wall.

- 3) Compare your scale drawing to a classmate's drawing. Are the drawings similar? Why might the drawings be different?

- 4) With a tape measure or metre stick find out how many centimetres long your pace is.
Measure several times to get an accurate answer.

- 5) Use your scale drawing and the length of your pace to find the approximate lengths (in metres and centimetres) of the objects in part (1). Measure with the tape measure to check your approximations.

TYPE: Activity

WHAT'S YOUR ANGLE?

Enlarging/Reducing with
Isometric Grids
Making a Scale Drawing
SCALING

Materials needed: Isometric grid paper, straightedge
Activity:

- 1) Draw a copy of this figure. Use a scale of 1:1.

- 2) Draw an enlargement of this figure. Use a scale of 2:1.

- 3) This is an enlargement drawn to a scale of 3:1. Draw the original figure.

- 4) Draw a reduction of the figure below. Use a scale of 1:2.

- 5) This is a reduction drawn to a scale of 1:3. Draw the original figure.

These figures can also be drawn with square grid paper.

- 6) What do you see?
Draw an enlargement.
Choose your own scale.

TYPE: Paper & Pencil

ARCHIE TEXS' RULER

Enlarging with a Ruler
Making a Scale Drawing
SCALING

Activity:

- (1) Complete the ruler by marking sides B and C to show the given scale.
- (2) Cut out this chart, fold on the lines, and paste the flap under to make your architect's ruler.

- (3) On another paper use the 1:1 scale to draw a rectangle 2 units wide and 4 units long.
- (4) Now use the 2:1 scale to make an enlargement of the rectangle that is 2 times as wide and 2 times as long.
- (5) Use the 1:1 scale and draw another rectangle. Make a 3 to 1 enlargement.
- (6) Use the 1:1 scale and draw a square 3 units on a side. Make a 6 to 1 enlargement of the square.

Challenge: Make a 4:1 enlargement of Jennifer's doghouse.

A Pen For Your Pencil

EnLarging with a Ruler
Making a Scale Drawing
SCALING

Materials needed: Ruler
Protractor
Tape
Poster board

Activity:

From the scale drawing of the pieces that make the pencil container, decide how much poster board you need.

Carefully draw the outline of the bottom, full size. Measure the drawing and use the scale. The bottom is a hexagon with equal sides and equal angles. Cut the bottom out of the poster board.

In the same way make 9 identical side walls from the poster board.

Arrange the pieces as they are in the scale drawing. (You should have three side walls leftover.) Tape each side wall to the bottom. Make sure there is almost no space between the edge of the bottom and the edge of each wall.

Bend two side walls up and tape them together along the edge where they touch. Bend up the other sides, one at a time, and tape them in place.

Tape the remaining three side walls together to make a three-pocket divider for the container. Place it in the container along the dotted lines of the scale drawing.

Decorate your pencil container.

TYPE: Activity

IDEA FROM: SRA Math Applications
Kit

For a sturdier container corrugated cardboard from shipping cartons could be used.

TAKE ME OUT TO THE BALL GAME

Reducing with a Ruler
Making a Scale Drawing
SCALING

Using a scale of 1 cm : 20 ft., make a scale drawing of this baseball field.

Place this diagram of home plate at the bottom of your paper and trace over these lines to help you get started.

A major league baseball diamond is a square 90 feet on each side. Outfields do not have a standard size. Using a ruler, draw this baseball field so that the distances from home plate to the outfield fence are the same as shown in the diagram.

- 1) Use your scale drawing to find how far it is:
 - a) if you run around the bases after hitting a home run. _____ ft.
 - b) across the infield from home plate to 2nd base. _____ ft.
 - c) across the infield from 1st base to 3rd base. _____ ft.
- 2) The pitcher's mound is located approximately in the middle of the diamond. Put the pitcher's mound on your drawing. How far is it from the mound to home plate? _____ ft.
- 3) Hank Aaron smashes a 250-foot hit into left field. Mark an "X" in your drawing to show where the ball might hit if the left fielder misses the catch. Compare your answer with a friend.
- 4) Reggie Jackson hits a towering fly ball 310 feet that is not a home run. With an "O" mark three possible spots where the ball can be caught.
- 5) The longest measured home run was hit in 1953 by Mickey Mantle. It traveled 565 feet. On the scale drawing this home run would have landed _____ centimetres from home plate. Can you show this on your drawing? _____
- 6) How far will the ball travel from the pitcher to the first baseman if the batter hits a line drive to the third baseman, who catches the ball while standing on third base and relays the ball to first base? _____
- 7) The batter hits a Texas leaguer (a short fly ball) into center field 190 feet from home plate. The second baseman receives the throw from the center fielder at second base. How far did the ball travel? _____

A football field is 100 yds. long and $53\frac{1}{3}$ yds. wide. Have students use a ruler and make a scale drawing of the field.

USE METRES IN YOUR YARD

Reducing with a Ruler
Making a Scale Drawing
SCALING

Botanical gardens attract many visitors each year. Much planning is necessary to have a good-looking garden. However, most of the work can be done on paper.

Plan a backyard that is 15 metres by 10 metres. Select a scale and draw a rectangle on graph paper with these dimensions. Be sure to write the scale at the bottom of the drawing.

Make a backyard plan that includes at least 3 trees, 8 shrubs, a patio, grass, and flower beds. Make rough sketches first until you are satisfied that you know where to place these things. When you are sure you know where everything should go, complete the scale drawing on graph paper. Use these symbols on your drawing. Be sure to draw the patio and flower beds to scale.

 · · shrubs

 · · trees

 · grass

 · patio

 · flower bed

What changes would you have to make to provide a little playground area in the yard?

Have the students compare grass area to total area, grass area to flower bed area, etc. by estimating or counting squares. By furnishing seed catalogues or advertisements from papers students can design their own flower beds. Have students find and record the costs of the plants or work within a fixed budget.

ROOM DECORATIONS

Enlarging with a Compass
and a Ruler
Making a Scale Drawing
SCALING

Most students enjoy constructing designs of various kinds. The designs shown here can be enlarged by any scale. Students could make enlargements according to the given scales or could choose their own scales. Other designs can be found in Creative Constructions by Seymour and Schadler and Line Designs by Seymour and Snider.

Students can make a bulletin board by creating their own designs and enlarging them.

Scale: 3 to 1

Scale: 5 to 1

Scale: 2 to 1

Scale: 4 to 1

Scale: 1 to 1

Scale: 3 to 2

Students may need to be shown how to divide the circumference of the circle into six equal parts by marking off the radius along the circumference of the circle.

WHAT'S THE POINT?

Enlarging Using Similar
Figures and a
Perspective Point
Making a Scale Drawing
SCALING

Students will probably need a teacher demonstration of the first problem.

1. Use a metric ruler to measure the sides of each figure to the nearest $\frac{1}{2}$ cm. Write these ratios.

$$A'B' : AB = \underline{\quad} : \underline{\quad}$$

$$B'C' : BC = \underline{\quad} : \underline{\quad}$$

$$C'D' : CD = \underline{\quad} : \underline{\quad}$$

$$D'A' : DA = \underline{\quad} : \underline{\quad}$$

2. Do all your ratios simplify to about 2:1?
3. Draw lines to connect A to A', B to B', C to C', D to D'. Extend these lines until they cross. Label this point P.
4. With a metric ruler measure these line segments and write the ratios.

$$PA' : PA = \underline{\quad} : \underline{\quad}$$

$$PB' : PB = \underline{\quad} : \underline{\quad}$$

$$PC' : PC = \underline{\quad} : \underline{\quad}$$

$$PD' : PD = \underline{\quad} : \underline{\quad}$$

These should all simplify to about 2:1.

A'B'C'D' is an enlargement of ABCD by a scale factor of 2.

P is the starting point for the enlargement.

5. Find P (the starting point for the enlargement). Measure the sides of the figures to find the scale factor of each enlargement.

Point P may be located outside, inside or on the figures.

(a)

(b)

Estimate the ratio

$$PD' : PD = \underline{\quad} : \underline{\quad}$$

check by measuring.

Enlarging Using Similar
Figures and a
Perspective Point
Making a Scale Drawing
SCALING

Demonstrate the first problem for your class.

To make an enlargement of triangle ABC using a scale factor of 2 do the following:

- 1) Draw lines from P through A, B and C.
- 2) On line PA mark point A' so $PA':PA = 2:1$.
On line PB mark point B' so $PB':PB = 2:1$.
On line PC mark point C' so $PC':PC = 2:1$.
- 3) Use a metric ruler to measure the sides of the two triangles. Write these ratios.

Hint:
Mark the length of segment PA on the edge of a piece of paper. Use these marks to find A'.

$A'B':AB = \underline{\hspace{1cm}} : \underline{\hspace{1cm}}$
 $B'C':BC = \underline{\hspace{1cm}} : \underline{\hspace{1cm}}$
 $C'A':CA = \underline{\hspace{1cm}} : \underline{\hspace{1cm}}$

Is each side in the new triangle about twice as long as its corresponding side in the original?

Trace each figure on another sheet of paper and use the scale factor to make an enlargement. P is the starting point for the enlargement.

(a)

scale factor of 2

An interesting extension is to use one figure and make several enlargements using different starting points.

(c)

scale factor of 3

(d)

scale factor of 3

(b)

scale factor of 4

(e)

scale factor of 2
then scale factor of 3
then scale factor of 4

A SHRINK

Reducing Using Similar Figures
and a Perspective Point
Making a Scale Drawing
SCALING

As readiness for the fractional scale factor you could show how enlargements by scale factors of 4, 3, 2, 1 get progressively smaller. Students could be asked what would happen with a scale factor of $\frac{1}{2}$.

If the scale factor is less than 1, the drawing actually becomes a reduction or shrink.

- ① Reduce triangle ABC by a scale factor of $\frac{1}{2}$. P is the starting point for the reduction.

P

- 1) Draw segments $\overline{PA}$, $\overline{PB}$, $\overline{PC}$.
- 2) Find A' so that $PA':PA = 1:2$.
Find B' so that $PB':PB = 1:2$.
Find C' so that $PC':PC = 1:2$.
- 3) Measure the sides of triangle A'B'C'. Is each side in a 1:2 ratio with its corresponding side in triangle ABC?

On another piece of paper trace each of the figures and do the reduction. In each problem P is the starting point for the reduction.

- ② Reduce by a factor of $\frac{1}{3}$.

- ③ Reduce by a factor of $\frac{1}{4}$.

- ④ Reduce by a factor of $\frac{1}{5}$.

TYPE: Paper & Pencil
IDEA FROM: The School Mathematics Project, Book D

A NEGATIVE FEELING

Enlarging/Reducing Using
Similar Figures and a
Respective Point
Making a Scale Drawing
SCALING

When the starting point of an enlargement or reduction is between the original design and the new design, the new design will be upside down. The scale factor is written as a negative number.

For example: Enlarge this design by a scale factor of -2 . P is the starting point for the enlargement.

- 1) Draw lines $\overline{PA}$, $\overline{PB}$, $\overline{PC}$, $\overline{PD}$, $\overline{PE}$.
- 2) On line $\overline{PA}$ locate A' so that P is between A' and A , and $PA':PA = 2:1$. Do the same for lines $\overline{PB}$, $\overline{PC}$, $\overline{PD}$, and $\overline{PE}$.
- 3) Measure the sides of the new design to see if each side is in the ratio of 2 to 1 with a corresponding side of the original design.
- 4) Is the new design upside down?

Copy each design on another sheet of paper and make the new design. Be sure to copy the point P .

Challenge: Stand the box on its end by making an enlargement with a scale factor of -2 .

Challenge: Find out what I think of my mother by making an enlargement of the word

Use a scale factor of -4 .

TYPE: Paper & Pencil
IDEA FROM: The School Mathematics
Project, Book D

PROJECTING THROUGH THE PINHOLE

TEACHER DIRECTED ACTIVITIES

Demonstration of
Perspective
Making a Scale Drawing
SCALING

- 1) This is a "practical" demonstration of the concept in *Bigger Than Life*.

Construct a 6-in. square and place it 1 ft. in front of a projector. Locate a screen behind the square at various distances from the projector, e.g., 2 ft., 3 ft. or 4 ft. Have students estimate the length of the shadow at each distance and then measure to check. Students should discover that $\text{length of square} : \text{length of shadow} = \text{distance of square from the projector} : \text{distance of screen from the projector}$. A discussion can be held on the ratio of the areas of the square and the shadow at each distance.

- 2) This is a "practical" demonstration of the concept in *A Negative Feeling*.

Make a small pinhole in a piece of heavy paper. Hold the paper about 4 inches from the wall and hold a lighted candle in front of the pinhole. The image of the flame projected onto the wall will be inverted. A diagram of how a simple camera works also illustrates this concept.

- 3) Use a slide projector and a 1-foot square frame to generate a series of enlargements with a constant scale factor, e.g., 2.

- a. Select a slide. Mark the center (dot with pen) for a reference point.
- b. Mount the frame on a wall.
- c. Position the projector about 2 feet from the wall so that the dot on the slide is projected in the center of the frame.
- d. Observe the portion of the slide projected inside the frame. Select an object(s) near the center of the frame (like the button above) and measure its length.
- e. Double the distance of the projector from the wall (keep the reference dot in the center of the frame).
- f. Note the image in the frame. Remeasure the object(s).
- g. Repeat. Students may predict new lengths of object(s) for new distances.

A SNAPPY SOLUTION TO SCALE DRAWINGS

Enlarging/Reducing with
Rubber Bands
Making a Scale Drawing
SCALING

Materials needed: Several identical rubber bands, a thumbtack, a centimetre ruler, butcher paper, large table.

Activity: Loop two identical rubber bands together to form a knot in the middle.

To enlarge triangle ABC:

- 1) Pick a point X so the distance from X to A is longer than the length of a rubber band.
- 2) Hold one end of the rubber band on point X with your thumb or the thumbtack.
- 3) With a pencil in the other end, stretch the rubber bands until the knot is over A. Mark a dot with the pencil and label the dot A'.
- 4) Repeat step 2 with the knot over B to find B', then over C to find C'.
- 5) Connect A', B', and C'.

Measure the lengths of the sides of the two triangles and write these ratios. Then write the ratios in simplest form.

$$A'B':AB = \underline{\quad}:\underline{\quad} = \underline{\quad}:\underline{\quad}$$

$$A'C':AC = \underline{\quad}:\underline{\quad} = \underline{\quad}:\underline{\quad}$$

$$B'C':BC = \underline{\quad}:\underline{\quad} = \underline{\quad}:\underline{\quad}$$

The rubber bands have helped you make a 2 to 1 enlargement. Do one of your own.

TYPE: Paper & Pencil/Activity

IDEA FROM: The Laboratory Approach to
Mathematics and Oakland County
Mathematics Project

A SNAPPY SOLUTION TO SCALE DRAWINGS (CONTINUED)

- 1) How many rubber bands would you use to make a 3 to 1 enlargement?
Could you make a 1 to 3 reduction?

- 2) Designs with curved lines can be enlarged by watching just the knot and moving the pencil so the knot traces over the design.

- 3) Find a design that you like and make a 3 to 1 enlargement. A large, simple design is easier to enlarge.

- 4) Use an enlargement done by a classmate and make a reduction of the design. Compare your reduction to the original design.

Challenge: Make a 5 to 2 enlargement of a design of your choice.

5 rubber bands are needed.
The second knot from X traces the original design.

THE PANTOGRAPH

Enlarging with a
Pantograph
Making a Scale Drawing
SCALING

E
S
I

The pantograph is a device used to make drawings larger or smaller. The pantograph makes use of ratios. Use the strips on the next page. Assemble them as shown above.

This flowchart tells how to use the pantograph to make a larger copy of a drawing.

Measure the sides of both figures to find the ratios of their sides.

TYPE: Activity

IDEA FROM: *Activities in Mathematics*,
2nd Course

Permission to use granted
by Scott, Foresman and Company

THE PANTOGRAPH

(CONTINUED)

A pantograph could be constructed from the strips in an "Erector-Set" kit. Two 17-hole strips and two 9-hole strips are convenient. Tongue depressors or popsickle sticks could also be used.

The pantograph does not copy curves easily.

After copying a figure, the student can measure corresponding parts of the figures, write and compare the ratios. If the ratios of the measures of corresponding sides are equal, the two figures are similar, i.e., they have the same shape.

A commercial pantograph or photograph of one would be nice to show students after they have constructed and worked with their own. Check to see if your mechanical drawing room has one.

Reproduce these strips on paper of file-folder thickness.

HOW TO MAKE A HYPSOMETER

Finding Height with a
Hypsometer
Making a Scale Drawing
SCALING

E
S
I

DISTANCE FROM OBJECT TEACHER DIRECTED ACTIVITY

To Make a Hypsometer:

- 1) Cut out a piece of corrugated cardboard 8" x 10".
- 2) Paste grid on cardboard (see picture below).
- 3) Punch a hole on the X and attach a plumb line--a 15" string with weight at opposite end (fishing sinker).
- 4) Tape a drinking straw to the top of the cardboard, laying it over the hole.

TYPE: Activity

IDEA FROM: Activities in Mathematics,
2nd Course

USING THE HYPSONETER

Finding Height Using
a Hypsometer
Making a Scale Drawing
SCALING

TEACHER DIRECTED ACTIVITY

- A. Have students measure the height of the outside wall of your school.
1. Measure a distance "d" from the wall.
 2. Sight through the drinking straw to top of wall. Find point T where the plumb line crosses the bottom of the grid.

3. Keep the string at T and find the distance "d" on the distance scale.
4. Go directly across to the point where the string crosses this line.
5. From that point go directly down to the height scale. This tells the height "h" of the wall above eye level.
6. To measure the height of the wall add "h" to the height of the viewer's eye from the ground.

- B. Have students work in pairs. Use a metre wheel and the hypsometer to measure the height of the flagpole, swing set, or large tree in the playground.

- C. In the classroom have students measure the height of the ceiling. One wall could be selected, heights of various objects on the wall determined, and graph paper could be used to make a scale drawing.

- D. At home the students could use the hypsometer to find the heights on the front of their houses. By using a tape measure and metre wheel, they could then construct a scale drawing of the front of their homes. The front of the school building could also be drawn to scale.

TYPE: Activity

IDEA FROM: Activities in Mathematics,
2nd Course

Reducing with an Instrument
Finding Lengths Using an
Alidade
Making a Scale Drawing
SCALING

TEACHER DIRECTED ACTIVITY

There are a number of ways to make a scale drawing of a field. Some methods use expensive pieces of equipment to do this accurately, but it is possible to make a good scale drawing using equipment from the classroom.

Equipment: Flat table or board
placed on top of an
inverted wastebasket
Ruler
Tape
*Alidade
Large sheet of drawing
paper

*An alidade is a straightedge
with sights and can be made
with a ruler and two nails.

1. The students should familiarize themselves with the region before beginning the scale drawing. Landmarks, especially those that indicate the shade of the region, should be located. The landmarks could be listed or a rough sketch of the region drawn with each landmark labeled. Markers are needed at the corners of the field if natural landmarks do not occur.
2. Label two wooden stakes P and Q and place them ten metres apart in the middle of the field. Be careful that the stakes are not in line with any of the landmarks.
3. Tape the large sheet of paper to the table. Select a suitable scale so that the drawing will fit on the paper. Near the center of the paper, mark and label two points corresponding to the stakes in the field, i.e., if a scale of 1 cm : 1 m is chosen, draw the two points 10 cm apart.

TYPE: Activity

IDEA FROM: Making Mathematics a Secondary
Course, Book 4 and SRA Math
Applications Kit

STAKE YOUR CLAIM

(Continued)

4. Place point P over stake P. Use the alidade to line up point Q on the paper with stake Q (you may have to turn the table slightly). The table must remain in this position as you sight each landmark from point P.

5. To sight a landmark from point P place one edge of the alidade against point P. Line up the landmark and draw a line to the edge of the paper. Repeat for each landmark.

6. To complete the activity move the table over stake Q. Line up point P with stake P. As above, use the alidade to sight each landmark from point Q. On the scale drawing each landmark is represented by the intersection of a line from P and a line from Q.

7. The field can now be represented by connecting the appropriate intersection points. The students should write the scale at the bottom of the drawing. Students may wish to check the accuracy of the drawing by actually measuring the distances between landmarks.

ANOTHER STAKE OUT

Reducing with an Instrument
Finding Angles Using a
Transit
Making a Scale Drawing
SCALING

TEACHER DIRECTED ACTIVITY

A homemade or commercial transit can be used to make a scale drawing of a field or playground.

Stakes P and Q should be positioned as they were in the activity entitled *Stake Your Claim*. Place the transit over stake P, record the transit readings for each landmark, and then repeat for stake Q. To make the commercial transit readings easier to interpret: place the transit over stake P, sight stake Q, and set the transit at 0° before sighting any landmarks. After moving the transit to stake Q, be sure to sight stake P and set the transit at 0°. A table will help students organize the results so that each landmark is paired with the appropriate transit reading.

Pin straw at center mark of the protractor.

Landmark	Reading at P	Reading at Q
light pole	60°	85°

In the classroom select a suitable scale. Use the scale to label two points, P and Q, i.e., if a scale of 1 cm : 1 m is chosen, P and Q are 10 cm apart. Connect P and Q with a line segment. The scale drawing can be completed by using the table of angle measurements, a protractor and a straightedge.

MAKE A DIPSTICK

Using a Scale to Determine
Depth
Supplementary Ideas in
Scaling
SCALING

TEACHER DIRECTED ACTIVITY

This activity calibrates a dowel which can then be used as a dipstick to check the level of fluid in a container.

Equipment: Eight to ten containers approximately the same height but having different shapes, e.g., detergent bottle, starch bottle, pop bottle, catsup bottle, milk carton, vase, bubble bath containers

Eight to ten thin wooden dowels

Eight to ten graduated cylinders that measure in ml (medicine cups from a hospital work nicely)

1. (a) Use an irregularly shaped bottle for a classroom demonstration. Let the students make conjectures about where the marks will appear. Pour 50 ml of water into the bottle. Carefully lower a thin dowel into the bottle until it touches the bottom. Lift the dowel out and mark the water level. Repeat the procedure until the bottle is full.
 - (b) The dowel is now calibrated to measure fluid levels in the bottle to the nearest 50 ml. The dipstick represents a scale for the bottle just as a legend represents a scale for a map.
 - (c) Discuss how the spacing of the marks is related to the shape of the bottle.
2. (a) Divide the class into groups. Give each group a bottle and have them make a dipstick for their container.
 - (b) Collect the bottles and the dipsticks. Have each group try to match the dipsticks with the appropriate containers.
3. (a) Ask students if they know of any uses for dipsticks.
 - (b) Suggest that each student check the oil and/or transmission fluid level in the family car.
 - (c) How does the gas station operator measure the fuel in the station's tanks? Suggest that each student check at their neighborhood station. Perhaps the attendant will demonstrate the use of the dipstick.

THE GEE-WHIZ CRAPH

Using Scales to Graph
Supplementary Ideas in
Scaling
SCALING

My parents think I watch too much television. I want to show my parents that I'm really cutting down. I have a record for a year with my monthly totals:

Month	J	F	M	A	M	J	J	A	S	O	N	D
Total T.V. hours	200	198	196	194	192	190	188	186	184	182	181	180

I could show them a graph like this. It's clear enough with zero at the bottom for comparison. But, it might not impress my folks.

I could cut off the bottom like this.

That's more like it!

Now, if I chop more off the top and bottom and change the scale, I get this GEE-WHIZ GRAPH!

LOOK! MOM, DAD!

T. V.
WATCHING
DOWN A
WHOPPING

THE PERPLEXING PENTOMINOES

Working with Shapes
Supplementary Ideas in
Scaling
SCALING

Materials needed: Five squares, 3 centimetres on a side, and centimetre grid paper or five 1-inch tiles and inch grid paper.

The grids should be duplicated on heavy construction paper.

Activity:

- 1) A pentomino is a pattern made by joining 5 squares together so that each shares a common side with another. How many different pentominoes do you think there are? _____
- 2) Take the 5 squares and make all the pentominoes that you can. Copy each pentomino pattern on the grid paper and cut out the shape. If one of the patterns can be turned or flipped to exactly fit another one, the two patterns are the same pentomino.
- 3) Check with your teacher to see if you have found all the pentominoes.
- 4) Try to arrange the pentominoes so that they make the rectangle. Do not overlap the pieces. There are more than 2000 ways to do this!

EXAMPLES

These four patterns are the same pentomino.

6 by 10 rectangle

5 by 12 rectangle

4 by 15 rectangle

- 5) Play a game using the pentominoes.

Needed: 2 players

Game mat is an 8 by 8 square constructed out of the grid paper with alternate squares shaded.

- a) Players alternate picking pentomino pieces until all the pieces have been selected.
- b) Each player in turn then places a pentomino on the mat. Play continues until it is impossible for a player to place on that mat a pentomino that doesn't overlap another pentomino or lie completely on the mat.
- c) The winner is the last person to successfully place a pentomino on the mat.

b) Does this sketch show the top of your model? _____  TOP
c) How many cubes are in your model? _____
d) How many cubes would be in the model if you used this scale, the edge of a cube : 10 metres? _____
- 2) a) Use a scale of the edge of a cube : 5 metres.
Make a model: 20 m long (front), 10 m wide (side), 50 m high.
b) Draw a sketch of the front of your model.
c) If this scale was changed to the edge of a cube : 2 metres, how many cubes would be needed? _____
- 3) a) Use a scale of the edge of a cube : 10 metres.
Make a model: 20 metres long (front), 40 metres wide (side), 80 metres high.
b) Draw a sketch of the side of your model.
c) How many cubes are in your model? _____
d) If you changed the scale to the edge of a cube : 5 metres, how many cubes would be needed? _____
- 4) a) You choose a scale to make this model.
30 m long (front), 30 m wide (side), 30 m high and a tower on top
10 m wide (front), 20 m wide (side), 30 m high.
Scale _____
b) Draw a sketch of the front, the side, and the top of your model.
c) How many cubes are in your model? _____
d) Compare the scale you chose to the scale chosen by a friend. If different, how does the number of cubes needed to make the model compare? _____

TYPE: Activity

BUILDING SEVERAL SKYSCRAPERS

Materials Needed: A set of cubes, a metric ruler.

Activity: Use the cubes to make models of the buildings below using a scale of the edge of a cube : 50 m. Fit the buildings together like this sketch.

TOP VIEW

	Length (front)	Width (side)	Height
Skyscraper 1	50 m	50 m	150 m
Skyscraper 2	400 m	50 m	200 m
Skyscraper 3	50 m	250 m	300 m

- Draw a sketch of what you would see if you were far away with your back to the East.
- Draw a sketch of the view with your back to the South.
- Make a scale drawing of the East view. Use a scale of the edge of a cube : 5 cm.
- Make a scale drawing of the South view. Use a scale of the edge of a cube : 1 cm.

Challenge:

Make your own skyscrapers, decide on a scale, and make a sheet like this for a classmate to do.

TYPE: Activity

Laboratory project— constructing a skyline

Constructing a Scale Model
Supplementary Ideas in
Scaling
SCALING

ERWIN EINHORN

Old Orchard Junior High School, Skokie, Illinois

I read with great interest and enthusiasm the article in the January 1970 issue of the *ARITHMETIC TEACHER* entitled "Problem Solving with Enthusiasm—the Mathematics Laboratory."

I believe that the mathematics laboratory is the thing of the future. With that idea in mind, I should like to make a contribution based in large part on the format used in the article just mentioned.

Constructing a skyline

1. Materials needed
 - a) Construction paper
 - b) Ruler
 - c) Protractor
 - d) Compass
 - e) Straight pins
 - f) Scissors
 - g) Spray paint
2. Assignment card
 - a) Using construction paper and scissors, construct and cut out the building designs indicated below. Use a scale of 1 inch = 100 feet.
 - (1) Department store—300 feet high, 500 feet wide
 - (2) Office building—1,050 feet high, 250 feet wide
 - (3) Church building—275 feet, 225 feet wide, with a steeple the top of which is 850 feet above the ground
 - (4) Apartment building—725 feet high, 150 feet wide, with a penthouse 25 feet high that is $\frac{3}{4}$ as wide as the building

- (5) Convention center—400 feet high, 300 feet wide, with a semi-circular dome 300 feet in diameter

- (6) One or two buildings of your own imagination

b) Pin the designs to a piece of construction paper.

c) Paint with spray.

d) When dry, remove the outline.

Additional information for the teacher

The objective of this experience is to increase understanding and encourage students to discover relations and procedures in the following areas:

1. Setting up problems that deal with ratio and proportion
2. Solving simple algebraic equations that use either cross multiplication or the method of the LCM
3. Using and reading measures from a ruler, protractor, and compass
4. Understanding various geometric figures
5. Reading directions of a mathematical nature
6. Acquiring various aesthetic appreciations in art

The advantage of a project such as this is that students can use their hands as well as their heads in learning. It not only gives them a good feeling about mathematics, but also encourages them to get involved in other laboratory projects.

EDITOR'S NOTE. I like this! Why not try it? CHARLOTTE W. JUNGE.

A SCALE MODEL OF THE SOLAR SYSTEM

Making a Scale Model
Supplementary Ideas in
Scaling
SCALING

TEACHER DIRECTED ACTIVITY

Materials needed:

Basketball, grain of sand, several peas, large straight pin, orange, peach, plum (or objects similar in size), metric tape measure.

Activity:

- (1) Look up the actual sizes and distances of the planets from the sun.
- (2) Take your class outside. Have one student stand at home plate of a ball field (or goal line of a football field) holding the basketball to represent the sun.
- (3) Have the students estimate the positions and sizes of the planets.
- (4) Place students holding the objects at the appropriate distances (until space runs out).
- (5) Refer to other distances as homes where students in your class live, i.e. Uranus would be the size of a small plum located at Nancy's house.
- (6) Some student(s) may wish to find the scale used for this activity by using the actual distances of the planets from the sun. The scale is about 1 m : 2,400,000,000 m or 1 m : 2,400,000 kilometres.
- (7) This would be a good activity to be done in cooperation with the science teacher during the study of the solar system.

If the sun is the size of a basketball,

Mercury is the size of a grain of sand 25 metres away.

Venus is the size of a pea 43 metres away.

Earth is the size of a pea 65 metres away.

Mars is the size of a large pinhead 99 metres away.

The asteroids are specks of dust averaging 366 metres away.

Jupiter is the size of an orange 402 metres away.

Saturn is the size of a peach 644 metres away.

Uranus is the size of a small plum 1 kilometre, 207 metres away.

Neptune is the size of a smaller plum 2 kilometres away.

Pluto is the size of a pea 2 kilometres, 414 metres away.

HOW HIGH THE MOON

Making a Scale Model
Supplementary Ideas
in Scaling
SCALING

TEACHER DIRECTED ACTIVITY

One of two movies, Powers of Ten or Cosmic Zoom, or the book, Cosmic View by Kees Boeke, can be used to emphasize the immense size of the solar system and the universe. If the book is used, the concept can be made more relevant by having students construct a square 1.5 metres on a side. In one corner draw a series of squares 15 cm, 1.5 cm and .15 cm on a side. These sides will show four successive powers of ten. The measurement of 15 cm is being used because it corresponds to measures used in the book.

Outside have students measure off a 15 metre square and place the 1.5 m square in one corner. If the school ground is large enough, measure off a 150-metre square.

Then, on a city map a 1500-metre square can be drawn with the school in one corner. By relating the series of squares to the pictures in the book numbered -2 through 4, students might get a "sense of scale." The .15 cm square will be similar to the picture numbered -2, and the city map square will be similar to the picture numbered 4.

The films are available from:

SCALING A MOUNTAIN

TEACHER IDEAS

Using Contour Lines
Supplementary Ideas in
Scaling
SCALING

Contour lines are used to show elevations of points on a map. Road builders, farmers, geologists, oceanographers, irrigation engineers, hikers and skiers are just a few of the people interested in the contour of the land.

Several demonstrations can be done to illustrate contour lines.

- 1) Several solids can be placed in an aquarium. By lowering (or raising) the water level and recording the results, a set of contour lines can be drawn.

- 2) If you have access to a sand pile (or clay), mountains of wet sand can be made. Cut off the tops of the mountains and record the results.

0 in.

Horizontal planes
defining contours at
successive levels.

- 3) Make a simple paper cone. Carefully trace around the base to show the largest contour line. By cutting strips off the bottom (or top) of the cone the remaining contour lines can be drawn.

- 4) Students with vivid imaginations could be asked to think about the world being flooded. They could draw sketches of the contour lines of mountains as the water receded.

TYPE: Paper & Pencil/Activity

IDEA: New Ways in Geography

- 5) Similarly, if you have students that have flown over cloud enclosed mountains (maybe you can find a picture to illustrate this), the students could describe this and draw a sketch of the contour lines as the clouds rose or fell.

SCALING A MOUNTAIN

(PAGE 2)

The following are problems that can diagnose a student's understanding of contour lines.

N Match each letter with a number.

1. Has two summits--the eastern one the higher.

2. Has its steepest slope on the south-east.

3. Is a round hill with twin summits.

4. It descends vertically on the west side.

5. The northern slopes are very steep.

Diagrams of mountains can be used from which students can draw their own contour lines.

Map

Top View

Match each number with a letter.

Oblique view

Side view

Overhead view

SCALING A MOUNTAIN

(PAGE 3)

Hikers make practical use of contour lines by determining the easiest and quickest route between two points on a map.

The standard units of measure for contour maps are feet. These maps have not gone metric yet.

A good rule of thumb is to reckon that for every contour line climbed (25 feet) you can run 100 metres on the flat. This diagram explains this formula.

CLIMB vs. DETOUR

The direct route over the hill is 330 metres long and climbs 175 feet. Therefore, this is equivalent to $300 + (7 \times 100) = 1,030$ metres of level travel. As the detour around the hill is only 900 metres, this could be the quicker route to Control 7.

The following are ideas for activities and investigations that could be developed into lessons.

- 1) Contour maps of the United States, your state and your area can be purchased from the Geological Survey for about \$1.00. For an index and order forms send a request for:

- a) Index to Topographic Maps of the Geological Survey
- b) Index to Topographic Maps of (your state)

The request should be sent to:

(west of the Mississippi River)
 Denver Distribution Section
 U.S. Geological Survey
 Denver Federal Building, Bldg. 41
 Denver, CO 80225

(east of the Mississippi River)
 U.S. Geological Survey
 Washington, D.C. 20242

- 2) Find the highest and lowest points of elevation for several states. Which state has the largest difference? Are there places in the United States that are below sea level?
- 3) Read about the pressure and temperatures of water in the ocean as a diver goes below sea level. Read about the mountains on the ocean floor. Which one is highest? What is the deepest point in the ocean? How far below sea level is it? Can you find a topographical map of the ocean floor?
- 4) Read about how the plant life changes as the elevation of a mountain gets higher. Label a mountain with contour lines according to the vegetation.
- 5) Read about the Lewis and Clark expedition or the Oregon-California trail. Draw a sketch and label the elevations of the cities, mountain passes and important points along the trails. How long did it take the travelers to finish their journeys? If the big snows started in November at elevations above 3000 feet, when would the travelers need to start their journeys westward?

THE GREAT LAKES

Using a Scale Drawing
to Find Distances

Maps
SCALING

Scale: 1 inch to 190 miles

The Great Lakes

- a. Lake Erie
- b. Lake Huron
- c. Lake Superior
- d. Lake Michigan
- e. Lake Ontario

Since various methods may be used, students should be encouraged to discuss how their estimations were done.

For example, the length of the riverboat route from Cincinnati to St. Louis could be approximated by laying a string along the rivers and then measuring the length of the string. Length of air routes could be approximated by measuring with a ruler or string. The mileage for land routes could be approximated by measuring with a string, using line segments or by referencing the route in an atlas.

Alternative routes could be substituted for problems #1, #3, #5, #6.

- 1) Cincinnati to St. Louis by air
- 3) Chicago to Cleveland by air, by land
- 5) Montreal to Minneapolis by land (around the Great Lakes)
- 6) Buffalo to Minneapolis by land and ferry boat

Other questions to ask: How much time? How many days? How much is the expense? What could be seen?

TYPE: Paper & Pencil

SOURCE: Greater Cleveland Mathematics Program, 6

Estimate the mileage for the following routes.

- _____ 1. Cincinnati to St. Louis by riverboat
- _____ 2. Duluth to Cleveland by the shortest water route
- _____ 3. Chicago to Cleveland by lake steamer
- _____ 4. Detroit to Chicago by air
- _____ 5. Montreal to Milwaukee by water
- _____ 6. Buffalo to Minneapolis by land

AROUND THE UNITED STATES

Using a Scale Drawing
to Find Distances
Maps
SCALING

This activity could extend over two days by doing parts 1 and 2 on the first day, collecting the papers to check the table, and then using the table to do part 3.

- 1) Find and record the distances between these cities. (Measure to the nearest $\frac{1}{4}$ -inch.)

Obtain some airplane flight schedules from a travel agent. United, TWA and Northwest Orient have fares listed.

Allow students time to examine the flight schedule and route map and interpret the reference marks.

	DENVER	LOS ANGELES	MIAMI	MINNEAPOLIS	NEW ORLEANS	NEW YORK	SEATTLE	ST. LOUIS
DENVER								
LOS ANGELES								
MIAMI								
MINNEAPOLIS								
NEW ORLEANS								
NEW YORK								
SEATTLE	1000							
ST. LOUIS								

Have students investigate to see if distance is proportional to cost. Compare the costs of direct to non-direct flights, e.g., N.Y. - L.A. vs. N.Y. - St. Louis - L.A.

- 2) Use a two-rubber band pantograph to help you draw a rough sketch of the United States from the picture at the top of the page. Locate the cities. The map scale is now _____:_____. How will the measured distances between cities change? Will the mileage between the cities change?

- 3) Plan a trip that starts and finishes in New York and includes stops at all the cities listed on the map. Write down the trip and the mileage between cities. What is the total mileage? _____ Could you find a shorter way to make the trip? Compare with a friend.

Is the shortest trip necessarily the cheapest?

FOREST FIRES ARE A REAL RISK

Using Angle Readings to
Locate Points on a
Scale Drawing
Maps
SCALING

This activity could be done with a protractor instead of a compass. Answers will be approximate.

Materials needed: Ruler and compass

Activity: Draw a line connecting Raven Peak Lookout and Charles Mountain Lookout.

1. A fire breaks out on the eastern slope of Saddle Peak. Draw lines from the fire to each of the lookouts. Place the center of the compass on a lookout with North (0°) on the line between the lookouts. Read the angle from North to South. What compass readings would each of the lookouts report? Raven Peak _____ Charles Mountain _____.
2. Raven Peak reports a fire at 113° and Charles Mountain reports the fire at 53° . Where is the fire located? _____
How far is the fire from Raven Peak? Measure to the nearest mile. _____

TYPE: Paper & Pencil

FOREST FIRES ARE A REAL BURN

(CONTINUED)

3. Raven Peak reports a column of smoke at 150° and Charles Mountain reports this at 100°. Find the location of the fire. _____
4. A fire breaks out on the northwest tip of Rolling Hill. What compass readings will each lookout report? Raven Peak _____ Charles Mountain _____. Which lookout is nearer to the fire?
5. A hunter is reported missing in the Upper Twin Creek area. A flare is seen during the night at 101° from Raven Peak and 42° from Charles Mountain. Where did the flare originate? _____. How far is it from Raven Peak? Measure to the nearest mile. _____
6. Since Millstown Sawmill is always burning scraps, what smoke readings should both lookouts ignore? Raven Peak _____ Charles Mountain _____.
7. Locate the following fires.

	Raven Peak Reading	Charles Mountain Reading	Fire Location
a.	79°	35°	_____
b.	165°	120°	_____
c.	107°	49°	_____
d.	158°	13°	_____
8. The ranger at Charles Mountain Lookout has to deliver supplies. His route will take him to Raven Peak Lookout, Millstown Sawmill, Trapper's Cabin, Bar-B Ranch, Wilderness Camp, and then back to Charles Mountain Lookout. Describe the route. Record the distance and compass reading from each stop to the next stop. _____

WHERE'S IT AT?

Scale of 2 cm : 5 minutes

Using a Time Scale
to Locate Points

SCALING

1. Your home is at the center of the circles. Use the scale to find the time each circle is away from your home.

2. How many minutes from your home are points X, Y, and Z?

4. Place the letter for each of these places according to the time from your home.

Try to determine the correct direction.

- | | | |
|-------------------|------------------|-------------------|
| a) school | b) grocery store | c) church |
| d) gas station | e) camp ground | f) movie |
| g) zoo | h) swimming pool | i) clothing store |
| j) public library | k) boating area | l) tennis court |
| m) bowling alley | n) playground | |

3. If it takes the same amount of time to travel to A or to B, are A and B necessarily the same time distance from your home?

TYPE: Paper & Pencil

IDEA FROM: The Nature of Recreation

OUR TOWN

Reading a Map
Maps
SCALING

Local maps can be used to develop map reading skills. A map of LaGrande, Oregon and sample student questions are provided. If a map of your town is not available, this map may be copied for class use.

As readiness for the activity, have students sketch the route they take from home to school. The sketch should include streets crossed and landmarks passed. A follow-up discussion should point out that even though these sketches are not scale drawings, they communicate valid information. The technique could be further developed by having students draw sketches for routes between two landmarks, i.e., the post office and the high school.

Students should be given time to familiarize themselves with the map before answering the worksheet.

- 1) How many schools does LaGrande have? _____
- 2) The railroad depot is located on _____ Street.
- 3) The postoffice is located on the corner where _____ Street and _____ Avenue meet.
- 4) The location of the library is _____.
- 5) The main highway from Pendleton to LaGrande to Baker is U.S. Route Number _____.
- 6) The highway from LaGrande to Wallowa Lake is State Route Number _____.
- 7) Locate the homes of three of your friends. Name the locations by writing one or two streets.
 - a) _____
 - b) _____
 - c) _____

Hand your descriptions to another student and see if he or she can find the houses.

- 8) Start at Eastern Oregon College and describe a route to the Union County Fairgrounds.
- 9) Use the scale of the map to estimate the length of your route in question #8.

- 10) Give your directions in question #8 to another student and see if he or she is able to follow your route to the fairgrounds.
- 11) Describe a route from your home to school. Estimate the distance.
- 12) Describe a route from your school to Pioneer Park. Estimate the distance.
- 13) The bridge on 2nd Street has been closed because of an accident. Describe an alternate route from the library to the Union County Fairgrounds.
- 14) Check with the fire department for a description of the fire routes. Sketch the route on your map if a fire is spotted on the corner of Greenwood Street and "X" Avenue.
- 15) Ask your mailman for a description of his route. How many miles does he travel in one day?
- 16) Check with the newspaper office or ask a friend with a paper route for a description of his route. Sketch the route on the map. Estimate the distance.
- 17) Plan a ten-mile benefit walk-a-thon through LaGrande.

TYPE: Paper & Pencil/Activity

- 2) Which trip will take more time? Tucson-Rapid City-Portland or Tucson-Tallahassee-Portland.
- 3) Other cities could be located by being x hrs. and y hrs. from two given cities.
- 4) If your car gets 9 km/l of gas and gas costs 15¢/l, find the cost of a trip.
- 5) Consult a United States map and have the students draw in the time zones. If a trip is started at a certain hour, what time will the clocks read in the new city at arrival time?

DO YOU KNOW THE WAY TO SAN JOSE ?

Reading a Map
Maps
SCALING

TEACHER IDEAS

A state road map can provide students with a variety of interesting and practical activities. If done at the beginning of the school year, the road map activity could be a diagnostic tool to use in ascertaining students' computational and problem-solving skills. These maps can be obtained from your State Highway Division or from oil company service stations. You may wish to obtain two or three different maps as each has some features of interest not found on the others.

To prepare the students for map reading, use the map's coordinate system to name your students' seats. Indicate the rows by letter and the columns by number. Refer to each student by his coordinate. "Who is student A-5?" "Who is sitting next to student B-2?" "What answer does student C-2 have to Problem #4?"

When students first receive the map, they should be given time to investigate the map. Refer to the chart of symbols and ask students to find examples on the map. The back of the map should also be investigated. City maps, mileage tables, and park information are usually provided.

On the following page are three sample student pages based on an Oregon map and a teacher idea for an extended activity using maps.

- 13) Are there any state parks with overnight camping facilities in square F-97? _____
- 14) Can you drive on the beach at Lincoln City? _____
- 15) What national monument is located near the southern border? _____
- 16) In the winter would it be wise to travel from Springfield to Sisters on Highway 242? _____

DISTANCE AND AREA

- 1) How far is LaGrande from Eugene by paved highway? _____
- 2) How far from LaGrande to Eugene by air? (Use the scale on your map.) _____
- 3) Find the distances to fill in the table below.

	Use the mileage table	Add numbers given on highways. (Use the shortest paved route)	Use a string and the map scale on the shortest paved route.
Bend to Burns			
Corvallis to Seaside			

- 4) How many miles long is the southern boundary of Oregon? _____
- 5) List the state parks within 15 miles of Redmond. _____
- 6) What is the airline distance from Brookings to Astoria? _____
What is the distance along Highway 101? _____
- 7) Determine which route is shorter: Ontario - Burns - Bend or Ontario - John Day - Redmond - Bend. _____
- 8) Find the distance up the Rogue River from Gold Beach to Agnes. _____
- 9) Lake Owyhee near Ontario has a perimeter of _____ miles.
- 10) Find the difference in elevation between Klamath Falls and Ashland. _____
- 11) Can you find two towns whose difference in elevation is the same as the air distance between them? _____ For example, Seio is 142 feet lower than Lostine and 142 miles away.
- 12) What is the largest lake in Oregon? _____ What is its coordinate section? _____ Use transparent grid paper to estimate the area of the lake in square miles.
- 13) Suppose you wish to build an airport in the center of the state. Find and describe its location. _____
The flying distance from the airport to Portland International Airport will be _____ miles.

A BICYCLE TRIP

A person is planning a 6-day bicycle trip. The route will be as follows:

FIRST DAY: Eugene to Florence to Newport
SECOND DAY: Newport to Astoria
THIRD DAY: Astoria to Portland on Hwy. 30
FOURTH DAY: Portland to Madras on Hwy. 26
FIFTH DAY: Madras to the junction of Hwy. 97 and Hwy. 59
SIXTH DAY: The junction back to Eugene

Based on the information related to this route, answer the following questions:

1. Could this person be you? _____
2. What will be the farthest distance for one day? _____
3. What will be the shortest distance for one day? _____
4. What will be the total distance for the trip? _____
5. What will be the average distance for one day? _____
6. If you could maintain this pace, could you bicycle from Eugene to New York City in 37 days? _____
7. Explain your answer to Question 6. _____

SEE THE SIGHTS

Students can be given an amount of money, \$500 apiece, and told to design a vacation trip lasting from 4 days to two weeks. Travel brochures, motel guides, sight-seeing fliers, and road maps can help them choose a destination and plan a route. During each class period the student can record the distance and expenses incurred for one day's journey of the trip on a log sheet.

Start of day odometer reading _____		Finish of day odometer reading _____	
0 at the beginning of the trip		miles driven _____	
mph for day _____		furnished by teacher	
driving time _____			
Amount of money at beginning of day _____		Amount of money left at end of day _____	
EXPENSES FOR DAY			
Meals	Gas and oil	Lodging	Miscellaneous
	1 can of oil for every 1,000 miles		(fares)

Several students may decide to travel together and pool their resources. "Hazard" cards can be provided to give the students practice in planning ahead and budgeting for the unexpected. Each day the student draws a card that might cause him/her to have a flat tire, find \$20, pay a traffic violation, lose a wallet in a restaurant, etc. Students should also budget enough money to return home from the vacation. At the end of the trip students could give a written or oral account of their vacation to the class.

This activity could be developed as a long-range class and/or individual project. A contest could be made between groups of students, the winner being the group who took the "best" trip for the money.

As an introductory or final activity, invite a travel agent to speak to the class.

The game "Mille Bornes" by Parker Brothers is a nice extension.

PERCENT

PERCENT

Percents are a very useful way to convey information. The graphics and percents at the right tell us quickly that the United States has a very small part of the world's population, but uses almost half of the world's resources. Substituting percent for actual data gives us a much more efficient way of making comparisons. Besides being a convenient way of conveying and comparing information, percents are constantly being quoted by newspapers, news announcers and businesses as rates of discount or increase.

Our money in the bank was only making 6%. By withdrawing some to buy these clubs at 20% off I made a 14% profit for us!

Many students acquire notions about percent before they formally study it in school. They hear about a 50% chance of rain, and many can even compute a 15% tip at a restaurant. Before beginning a unit on percent, why not have an informal discussion with students to see how extensive their intuitive grasp of percents is? Can they compute a tip? What does 10% chance of rain mean? 100% chance? What does 100% mean? Can anything be over 100%?

POPULATION

WORLD'S RESOURCES USED IN ONE YEAR

IS UNCLE SAM A GLUTTON?

The U.S., with only 5.7% of the world population, consumes 40% of the resources the world uses in a year. If all other peoples were raised to our standard of living, the known resources of the world would be exhausted in decades.

Banks advertise their interest rates and stores promote sales with "X% off." Many important questions come out of the percents we confront daily. With the cost of living rising as it has, will that 10% raise make your salary worth as much as last year's? Would you be money ahead by borrowing money for one month rather than taking money from a savings account and losing a quarter's interest?

SALE 20% OFF

20% off doesn't mean a darn thing until you know what percent they tacked on in the first place.

PERCENT SENSE

When teaching percent we tend to rush toward fraction, decimal or proportion computation. Students move the decimal point two places, then multiply or divide without knowing whether their answer is sensible or whether they could have solved the exercise in their heads. There are activities which can help students focus on understanding percent without reverting to decimals, fractions or proportions. In this resource we have placed such activities under the topic Percent Sense. Pages from the Percent Sense section can supplement the learning of percent in many ways; they are not intended to be taught first in all cases. You might choose to use some of these activities after percent has been introduced as a ratio or rational number. Some of the specific ideas stressed in this section are discussed below.

Percent Means Per Hundred

Percent is closely tied to the word hundred. Here are some typical statements included in introductions or definitions of percent.

- Percent; by the hundred; in the hundred.
- A special ratio which compares a number to 100 is called a percent.
- It is reasonable for students to think of 5% as meaning 5 for every hundred.
- ...percent means per hundred. Thus, 61% means 61 per hundred.

The everyday phrases shown in the above student page can be used in building the concepts of percent. If 25 for every 100 can be written as 25% and if there are 25 seniors for every 100 students, then 25% of the students are seniors. Hundred grids of various sizes and shapes can be used to represent the 100 part of percent. A pattern of squares can be shown aside from the 100 grid, and students may be asked, "What percent of the reference grid is shown by the design?" Since the design is

is _____ % of

Percent Means

15 RED APPLES FOR EVERY 100 APPLES IS 15% RED APPLES.
45 BOYS FOR EVERY 100 STUDENTS IS 45% BOYS.

LOOK... THIS IS THE SYMBOL USED FOR PERCENT.

OTHER PHRASES USED FOR PERCENT ARE
PER 100
OUT OF 100
FOR EACH 100, AND
COMPARED TO 100.

WRITE EACH OF THESE AS A PERCENT.

- 30 DAYS OUT OF 100 DAYS
- 65¢ COMPARED TO 100¢
- 40 CM PER 100 CM
- 12 BLONDIES FOR EVERY 100 PEOPLE
- 1 ROTTEN APPLE FOR EVERY 100 APPLES
- 73 SHADED SQUARES COMPARED TO 100 SQUARES
- 83 PROBLEMS CORRECT FOR EVERY 100 PROBLEMS
- 98 YEA VOTES PER 100 VOTES
- 21 GREEN CARS FOR EVERY 100 CARS
- 8 MISPELLED WORDS OUT OF 100 WORDS

DESCRIBE EACH OF THESE SITUATIONS IN OTHER WAYS.

- 40 BLUE MARBLES, 100 MARBLES IN ALL
- 30 POODLES, 100 POODLES IN ALL
- 15 CHINESE, 100 PEOPLE IN ALL
- 80 CORRECT ANSWERS, 100 QUESTIONS IN ALL
- 55 DOLLARS, 100 DOLLARS IN ALL
- 8 TREES DEAD, 100 TREES IN ALL

made of 20 squares and the grid has 100 squares, the design is 20% of 100. This suggestion and other such ideas are developed in the classroom materials.

Questions based on the idea of 100 should be answered and understood before going to more complicated work with percent. The so-called three types of percent problems may be included.

- a) 17% of 100 = ____ b) 80 is ____% of 100 c) 21 is 21% of ____
 d) 32 is what percent of 100? e) What is 57% of 100?
 f) Sam answered 67% of the questions correctly. If he answered 67 questions right, how many questions were there?

Exercises like these require no computation, but they do focus on the close relationship of percent to 100 and on word phrases which are used to relate pairs of quantities and percent. Later these phrases will be used in more complicated settings.

But 100% is Everything!

Students often think the idea of 150% is absurd, since 100% of something is all there is. Perhaps we encourage their objections by overconcentration on phrases like "20 out of 100" and diagrams like the one shown at the right. It seems ridiculous to say "150 out of 100," and how could we shade 150% of the squares? To avoid this problem the phrases "for every 100, per hundred or compared to 100" could be used instead of "out of 100." Percents over 100 can be used when introducing percents--not reserved for later. The reference 100-grid can be kept to the side and various percents of the grid shown. A discussion of this approach is given in *Percent Introduction with Transparencies*.

20% of the square
is shaded

R

45% of R

150% of R

Number patterns can be used to make percents over 100 plausible. A sequence of exercises leading to percents greater than 100 can be given. $60 = \underline{\hspace{1cm}}\%$ of 100, $80 = \underline{\hspace{1cm}}\%$ of 100, $100 = \underline{\hspace{1cm}}\%$ of 100, $120 = \underline{\hspace{1cm}}\%$ of 100. Those students who understand when a glass is 100% full can be asked, "How full is a glass of mounded-up slushes or ice cream?"

There is an important idea about percent which sounds very much like, "But 100% is everything!" The combined parts of a whole are 100% of the whole. The page at the right addresses these ideas and is a good readiness activity for making percent circle graphs. If 25% of the money is spent, 75% is left. (A question for discussion is, "If 25% of the money is spent, is there any left over? Can you think of any cases where 125% of the available money was spent?")

If You Know 10%, You Know a Lot!

If an item is advertised at 10% off for a \$12 savings and later it is marked 25% off the original price, what is the dollar savings for the new discount? The computation and method-oriented person might write:

$$10\% \text{ of } y = \$12, \text{ so (by the proportion method) } \frac{10}{100} = \frac{12}{y}$$

$$\text{Now } 10y = 100 \times 12, \text{ so } y = \frac{100 \times 12}{10} = 120$$

$$25\% \text{ of } y = 25\% \text{ of } 120 \text{ and } \frac{25}{100} = \frac{z}{120}$$

$$100z = 25 \times 120, \text{ so } z = \frac{25 \times 120}{100} = 30$$

A person using his percent sense can reason like this:

10% of the price was \$12.
 20% of the price is twice as much or \$24.
 5% of the price is half as much or \$6.
 $\$24 + \$6 = \$30$.

The computations required for the first type of solution are much more complex than for the second type. Some people develop the ability to solve problems mentally; they are fortunate. We can encourage more mental computation by providing appropriate exercises. Some questions from the student page *The Whole Thing* are given below with a way of solving each. Students might find other reasonable ways to solve these.

1 \$ 1 1 \$ 1 1 \$ 1 This is 75% of the cost. Each one will be ____% of the cost. Two will be ____% of the cost. The total cost is \$ ____. Think: \$ 3 is 75% of the cost. \$ 1 is 25% " \$ 2 is 50% " \$ 4 is 100% "	80% of the barrels. How many barrels in all? Think: 4 is 80% of the barrels. 1 is 20% " 5 is 100% "
--	--

The strategy here is to multiply (or divide) both numbers by the same factor. The same idea can be developed using geometric figures. If is 50% of an object, what might 100% of the object look like? Possible answers: or or Activities which incorporate this strategy are *Percents of Line Segments*, *Percents of Rectangles*, *Finding 100% From Above*, *Finding 100% From Below*, *Percents: Backwards and Forwards* (1, 2, 3, 4) and *Peace-N-Order*.

Comparison

A useful part of percent sense is knowing how $N\%$ of A compares with A . Is $N\%$ of A less than, greater than or equal to A ? When a student computes 85% of 20 and obtains 170, his percent sense can catch the error if he knows that 85% of "something" is less than the "something." This kind of percent sense can also

be used to catch keypunch mistakes on a calculator. The skill-building page shown at the right includes comparing a percent of a number to the number, and it also asks the student to compare numbers like 50% of 80 to 25% of 80 or 120% of 90 to 120% of 70. How do the values compare when the base number is kept the same and the percent is changed? How do they compare when the percent is kept the same and the base number changed? Other pages covering this concept are *A Sign of the Times*, *Enormous Estimate*, *Love Is Where You Find It* and *Smile*.

Percents Backwards and Forwards

On the student page *Percents: Backwards and Forwards 1* students determine the percent one geometric shape is of another. When A is 20% of B, B is 500% of A. The completed table from this student page is shown at the right. What is the relationship between the two columns of percent? Students being introduced to percents might notice that as the percents increase on the left, they decrease on the right. A more advanced class which can change the percents to decimals could discover that the product of the two decimals is always 1.0000.

YOU ARE WHAT YOU EAT

AN APPLE A DAY KEEPS THE DOCTOR AWAY

AN _____ A DAY KEEPS _____ E _____ AWAY

11 8 3 15 5 12 7 1 14 4 9 2 6 10

For each exercise circle the letter in either the +, -, or × column that compares side A to side B.

200	50
400	25
500	20

PERCENT AS RATIOS

How would a student find 5% of 400? If he had been told 5% means 5 for every hundred, he might reason that there are 4 hundreds in 400 and then multiply 4×5 to find 20. This contrasts to the decimal method of dividing the percent number by 100 and then multiplying times 400. Even though percents were historically developed as another form for fractions and decimals, the treatment of percent as a ratio is desirable and mathematically sound. If a percent is written as a ratio (a pair of numbers) as shown at the right, both numbers can be multiplied or divided by the same number, and the same percent number can be used to relate the new pair of numbers. Approximation can also be used with percents or ratios. The exercise below is from *That's "About" Right*.

75% MEANS

75 FOR EVERY 100 75% OF 100 IS ____.

• DIVIDE BY 25

• 3 FOR EVERY 4 75% OF 4 IS 3.

• MULTIPLY BY 5

• 15 FOR EVERY ____ 75% OF ____ IS 15.

30 FOR EVERY ____ 75% OF ____ IS ____.

11% MEANS

• DIVIDE BY 11

11 FOR EVERY 100

11% OF 100 IS ____.

• • • ABOUT 1 FOR EVERY 9

11% OF 9 IS ABOUT ____.

• • • • ABOUT 7 FOR EVERY 63

11% OF 63 IS ABOUT ____.

• MULTIPLY BY 7

14 FOR EVERY ____

11% OF ____ IS ABOUT ____.

In late middle school the treatment of percents as ratios can be supplemented by the use of formal proportions for solving percent problems. A proportion is a statement of equality of two ratios. When using proportions to solve percent problems, the ratios are usually written in fraction form. Instead of writing 30% as 30 for every 100, we write it as $\frac{30}{100}$. To find 30% of 40 we need only to find the missing term in the proportion $30:100 = A:40$ or in fraction form $\frac{30}{100} = \frac{A}{40}$. Using cross products we have $30 \times 40 = 100A$ or $1200 = 100A$ and $A = 12$. Some basic properties of equality are applied in such a solution, but this is often less difficult for students than the traditional decimal methods. Students need to know that they can multiply or divide both sides of an equation by a nonzero number and that equality is reversible ($4 = A \rightarrow A = 4$). Some preliminary work with simple equations like $10 = 3A$ would be beneficial.

The proportion method unifies the three types of percent problems to the problem of finding the missing term of a proportion. The student will still have the task of deciding how the numbers in the problems relate so that a correct proportion can be written. See *Solving Percent Exercises by the Proportion Method* for more ideas on this. Below are three word problems and their proportion solutions. Students will probably use more steps in solving the proportions.

- a) A sale advertises 15% off.
How much is saved on a \$10 shirt?

$$\frac{15}{100} = \frac{A}{10}$$

$$15 \times 10 = 100A$$

$$A = \frac{150}{100} = \frac{3}{2}$$

answer: \$1.50

- b) A car was bought for \$3000 but is now worth only \$1800. What percent of the original price is the current value?

$$\frac{N}{100} = \frac{1800}{3000}$$

$$3000N = 100 \times 1800$$

$$N = \frac{180000}{3000} = 60$$

answer: 60%

- c) A tent is marked 80% of the original price. What was the original price if it costs \$96 now?

$$\frac{80}{100} = \frac{96}{B}$$

$$80B = 100 \times 96$$

$$B = \frac{9600}{80} = 120$$

answer: \$120

Of course, there are other percent problems which do not fit into the three basic types of problems. Two such problems are given below.

- a) 25% of the class is done with their work. What percent of the class is not done?

No proportion is needed here, but it is necessary to have a good understanding of percent to see that 75% of the class is not done. The student page *Help!* in *Percent Sense* covers this concept.

- b) A car was bought for \$3000 and is worth \$2100 a year later. What was the percent of depreciation?

This is a 2-step problem, a variation of the car problem above. It must be seen that subtraction is necessary.

$$\$3000 - \$2100 = \$900 \text{ or } \frac{M}{100} = \frac{2100}{3000}, \text{ so } M = 70\%$$

$$\frac{N}{100} = \frac{900}{3000}, \text{ so } N = 30$$

$$100\% - 70\% = 30\%$$

answer: 30%

The *Elastic Percent Approximator Extended* and the *Grid Percent Calculator* in the section on Solving Percent Problems both use proportions to solve percent exercises. To find 20% of 60 the proportion $\frac{20}{100} = \frac{x}{60}$ would be used. Solving the proportion gives $x = 12$. Can you see how the calculators below relate the numbers 12, 60, 20 and 100?

PERCENTS AS RATIONAL NUMBERS

Most of us learned about percents through fractions and decimals. 25% means $\frac{25}{100}$ or .25 and $4.6\% = \frac{4.6}{100} = \frac{46}{1000} = .046$.

The rule for changing a percent to a decimal is, "Move the decimal point two places to the left and drop the %" and for changing a decimal to a percent, "Move the decimal point two places to the right and add the %." Now, if all the computation with decimals is clear, a percent exercise reduces to a decimal computation. The understanding of percents as decimals is useful when using a calculator. The percent key on a calculator usually moves the decimal point two places to the left. To enter 35.7% push [3], [5], [.] , [7] then [%]. The calculator will read .357. The question "What percent of 80 is 50?" translates to $N \times 80 = 50$ or $N = 50 \div 80$. A calculator will give $50 \div 80$ as .625000. This number must then be changed to a percent: .625000 $\rightarrow$ 62.5%.

To change a percent to a fraction, we write the percent number over 100 and drop the percent sign. Changing a fraction to a percent is not so simple. We usually convert the fraction to a decimal ($\frac{2}{3} \approx .667$) and then to a percent (66.7%).

Knowing the fraction equivalent for certain percents is very helpful. If 25% is exchanged for the fraction $\frac{1}{4}$ and approximation is used, the question 25% of 83 is ? becomes an easier mental exercise: 25% of 83 $\approx \frac{1}{4}$ of 84 = 21.

We can help students learn the decimal and fraction equivalents for percents with manipulatives, 100-grids, number lines and various skill-building activities. See the classroom activities *The Percent Bar Sheet*, *Hallelujah I've Been Converted*, *Fractions $\rightarrow$ Percent 1* and *Fractions $\rightarrow$ Percent 2*.

SOLVING PERCENT PROBLEMS

Word problems involving percent are usually confusing to students. They can work a series of problems when an example is given and the problems are of the same type as the example, but when word problems of different types are mixed, they can't decide what operation or proportion to use. If we encourage students to spend time understanding the problems before manipulating the given numbers to find "answers," their ability to solve problems might improve.

Suggested Activities

1. Put two simple percent word problems on the board or overhead. Ask the students if the problems could be worked in the same way or not. The problems (a) and (b) at the right could both be solved by taking the given percent of the given number.

Now add a few more simple problems like (c), (d) and (e) as shown. Ask if any of these can be solved like problems (a) and (b). Some students might pick problem (d) but notice the extra step in (d); subtraction is also involved.

Are any two of the new problems solved in the same way? Yes. (c) and (e) are both solved by finding what percent one given number is of the other.

- a) 50 math problems. Got 90% correct. How many correct?
- b) 30 girls. 20% are blond. How many are blond?
- c) Played 10 games. Won 6. What percent of the games were won?
- d) Regular price \$9. Sale is 10% off. What is the sale price?
- e) 40 trading cards. 12 are baseball cards. What percent are baseball cards?

2. After comparing and discussing problems of various types and complexity, students can be asked to match problems which would be worked in the same way. There are 6 types of percent problems given below; two of each type. Each problem on the left can be matched with one on the right. This is not an introductory activity—it is necessary that students have previously solved and discussed each of these kinds of problems. Whether students have learned to solve percent problems with the proportion method or by changing the percent to a decimal or fraction should not affect their matching of the problems. To keep confusion to a minimum you could sort the problems into 2 groups with 3 types per group. The "matches" are given below.

- | | |
|---|---|
| a. If the annual interest rate is 7%, find a year's interest on \$1200. | _____ 1. Jon took \$8 to the fair and came home with \$3. What percent of his money did he spend? |
| b. Chris spent 40% of her savings for a bike. If the bike cost \$60.00, how much was in her savings before she bought the bike? | _____ 2. A class has 30 students. 55% are girls. How many are boys? |
| c. A school has 5500 books. 45% are being used. How many are <u>not</u> being used? | _____ 3. A babysitter receives a 10% raise. He was making 80¢ an hour. How much does he make per hour now? |
| d. A city has 12,000 people. Its population is expected to increase 15% in 10 years. What is its expected population in 10 years? | _____ 4. A basketball team won 60% of its games. If 12 games were won, how many were played? |
| e. There are 30 teachers for a junior high. 18 are women. What percent of the teachers are women? | _____ 5. A record is regularly \$5.98. It is on sale at 15% off. How much is saved by buying it on sale? |
| f. A radio was originally \$60. Its reduced price is \$48. What is the percent of the reduction? | _____ 6. Jay was given 8 problems for homework. He got 6 problems right. What percent of the problems were right? |

Match a to 5, b to 4, c to 2, d to 3, e to 6 and f to 1.

REFERENCE SET

TEACHER DIRECTED ACTIVITY

Reference Set of 100*
Percent Sense
PERCENT

Prepared transparencies are a convenient means for an introduction to percent. The same transparencies can provide a review of the basics of percent. The transparencies that follow and the suggestions below can be used for this introduction.

Teacher Strategy

Tell students that percents are easiest to understand when they are based on a reference set of 100. Write REFERENCE SET on the board (or overhead) and say that this reference set might be the number 100, 100 squares, 100 pennies, or 100 centimetres, or any other convenient set.

Square Grid Transparency

Use the first transparency, showing only the 10 x 10 grid. Talk about a 10 x 10 array as a convenient (but not the only) way of arranging 100 little squares. This 10 x 10 grid will be the reference set (which we'll call R) for this transparency. Uncover the entire top row. Tell the class that each of the figures is a certain percent of the Reference Set R. Write "20% of R" under the first figure and ask the students to raise their hands if they know what should be written under the next figure.

Students then volunteer phrases to place under the remaining figures in the top row. Ask them to describe what 50%, 60%, 90% of R looks like. At this point discuss counting the squares to determine the percent of R shown. Emphasize that when the reference set (R) is 100 objects, N% of R is N of the objects.

Ask them if they know what 100%, 120%, and 200% of R looks like. Have students look at the second row and discuss and label each of the figures. The last problem brings out different arrangements of 20% of R. Emphasize that 20% of R is less than R, 100% of R is the same as R, and 120% of R is greater than R.

The third and then fourth rows of figures can then be uncovered and labeled with percents of R.

Line Segment and Dollar Transparency

To give students other models for percent look at the line segment and dollar transparency. Ask students to describe how to draw N% of the line segment R for various values of N (see transparency).

Other Grids Transparency

Look at the unusual 100 grids briefly to reinforce the idea that the reference set of 100 could be things other than squares, line segments, or pennies.

Use a marker with ink that washes off like Vis-a-Vis brand or Flair.

FILL IT UP!

Reference Set of 100
Grid Model
Percent Sense
PERCENT

Needed: 2 to 4 players

Game grids

3 dice marked as follows:

#1 marked 1%, 3%, 7%,
18%, 21%, 33%

#2 marked 2%, 4%, 8%,
19%, 27%, 30%

#3 marked 5%, 9%, 20%,
13%, 6%, 12%

Rules:

Each player selects a grid to fill up.

Each player rolls #1 die. Highest percent goes first.

Each player rolls all dice and selects one amount to shade on his grid.

If all amounts are too large, no part may be shaded.

Winner is the first player to exactly fill his grid.

TYPE: Game

IDEA FROM: Enhance Chance

A game sheet will be needed for each game unless just 2 players are playing. Dice can be made from cubes of wood with stick-on markers or cubes of styrofoam.

GUESS and Check

Students will need a transparent 100 grid to find the exact percent. See the following page.

Reference Set of 100
Grid Model
Percent Sense
PERCENT

In each problem the REFERENCE SET (R) is the large square.

First, approximate the percent of R that is shaded. Then, using the transparent 100 grid, find the exact percent of R that is shaded.

Guess: _____ % of R shaded
Exact: _____ % of R shaded

Guess: _____ % of R shaded
Exact: _____ % of R shaded

Guess: _____ % of R shaded
Exact: _____ % of R shaded

Guess: _____ % of R shaded
Exact: _____ % of R shaded

Guess: _____ % of R shaded
Exact: _____ % of R shaded

Guess: _____ % of R shaded
Exact: _____ % of R shaded

- ⑦ On how many of problems 1-6 was the % you guessed within 5 of the exact %? _____

- ⑧ This blob has about the same area as the reference sets above. Approximate the percent of the blob that is shaded. _____ %

The dots are the corners of the transparent 100 grid.

After finishing the sheet students might

- 1) list all the approximations,
- 2) find the highest, lowest, and average of the approximations, and
- 3) discuss methods for finding an exact answer. (We know of no easy way. The statement is intended for discussion.)

TRANSPARENT 100 GRIDS

This page can be used to make transparent grids for students to use with several activities. Cut around the outside border.

THE TRANSPARENT HUNDRED

Students will need a transparent 100 grid. See the previous page.

Reference Set of 100*
Grid Model
Percent Sense
PERCENT

THIS IS A HUNDRED GRID.

GUESS WHAT PERCENT OF THE HUNDRED GRID EACH SHAPE BELOW REPRESENTS. WRITE YOUR GUESS INSIDE THE SHAPE, THEN USE THE TRANSPARENT 100 GRID TO FIND THE ACTUAL PERCENT.

Extensions: Some of the grid letters can be made into words. For example, use the letters A and T. Find the total percent of the 100 grid that these letters represent. (80%) Sentences can also be formed. (Notice that the letters F, L, and H are contained within E, T, and A, respectively.) For example, find the total percent of the 100 grid that this sentence represents; THE FAT ELF ATE. (456%) Have students find more words and sentences and write the percent of the 100 grid that each represents.

ELASTIC

PERCENT APPROXIMATOR

Reference Set of 100
Number Line Model
Percent Sense
PERCENT

TEACHER IDEA

A piece of elastic or a rubber band can be made into a percent calculator for approximating.

You can use:

- a 3" piece of $\frac{3}{16}$ " elastic (the smaller the width, the more the stretch)
- a $2\frac{1}{2}$ " - 3" piece of a rubber band that is $\frac{1}{8}$ " - $\frac{1}{2}$ " wide

Two students work together to mark the elastic (rubber band). One stretches the material along the scale at the top, while the other marks the divisions on the elastic (rubber band). If the material is wide enough, the left end can be labeled 0%, the middle 50%, and the right end 100%. Note: These labels assume that the part of the elastic with the marks is the reference set (100% quantity).

At this point, the students should experiment with the elastic to see that the marks remain evenly spaced regardless of how much it is stretched. They should be reminded that their answers will be approximate and that each segment represents 10% of the reference set because the reference set (100%) was divided into 10 equal parts.

The next page shows examples of student problems. Depending on your students, you may want to supply separate worksheets on the length, area, and volume concepts or include all three on the same worksheet. It is hoped that students will see that $n\%$ of a quadrilateral with opposite sides congruent can be shown in two ways and that $n\%$ of a 6-sided polyhedron with opposite faces congruent can be shown in three ways.

TYPE: Manipulative
IDEA FROM: Oakland County Mathematics
Project

See *Elastic Percent Approximator*
Extended for a related activity.

ELASTIC

PERCENT APPROXIMATOR

(CONTINUED)

EXAMPLES OF STUDENT PROBLEMS

Example 1: Divide this line segment so the left-hand part represents 40% of the entire line segment.

- Place 0% on the left-hand endpoint.
- Stretch the elastic until 100% falls on the right-hand endpoint.
- Mark a point to represent 40% of the line segment.

Example 2: Divide a parallelogram so the left-hand part represents 75% of the parallelogram.

- 0% on left endpoint - 100% on right endpoint
- Approximate 75% and mark.
- Repeat on top segment.
- Connect points.

Note: If the side dimension is less than the length of the elastic, the elastic could not be used to find 75% of the parallelogram.

Example 3: Divide a cube so the left side shows 50% of the cube.

- 0% on left endpoint - 100% on right endpoint.
- Mark 50%.
- Repeat on other edges.
- Connect points.

Note: Similarly the front 50% and the bottom 50% can be found.

These three concepts could be developed into a series of lab activities using 1) different lengths of string for the lines, 2) transparent quadrilaterals and a felt tip pen for marking, and 3) transparent commercial polyhedron models with a felt tip pen for marking.

Percents of Line Segments

Reference Set of 100*
Number Line Model
Percent Sense
PERCENT

TEACHER IDEAS

In some cases it is possible to split an object or number (R) into into 100 equal pieces and by taking N of the pieces determine N% of R. This N could be 20%, 100%, 200%, or even $\frac{1}{2}\%$. In other cases it is easier to split R into 10 equal parts. In these cases one part is 10% of R so 20% of R would be 2 of the parts, 75% of R would be $7\frac{1}{2}$ parts and so on. In still other cases a split into 2, 3... parts is more helpful.

The suggestions below apply these concepts to line segments. These suggestions could be developed on a blackboard, overhead, or on dittoed sheets. Some students may need to review the number line concepts covered in *Number Lines I - VII*. If student worksheets are written, the *Elastic Percent Approximator* or a prepared key can be used by the student to check his work.

- I. Two line segments are given (R and $\frac{1}{2}$ of R). The student is asked to estimate what percent one is of the other.

Example: $\frac{1}{2}R =$

Solution Strategy: Split R into 10 approximately equal parts.
Each part is 10% of R. $\frac{1}{2}$ of R is about 4 parts. A good guess is 40.

- Problem Suggestions:
- a) Cover percents <, = and > 100.
 - b) Some problems can be included where the 2 line segments do not "line up" at the left end. (See example below.)
 - c) Vary R from the first to second line segment.

Example: $\frac{1}{2}$ of R =
R =

- II. A line segment (R) is given. The student is asked to draw N% of the line segment. Do not expect exact measures.

Example: $\frac{1}{2}R =$
 $30\% \text{ of } R =$

Solution Strategy: Split R into 10 approximately equal parts.
30% of R is 3 of the parts.

30% of R =

- Problem Suggestions: 30%, 50%, 80%, etc. first, then move to 25%, 75%, 5%. Include 100% and then percents over 100.

- III. A line segment (N% of R) is given. The student is asked to draw R.

Example: $20\% \text{ of } R =$
R =

Solution Strategy: 40% of R is 2 of the segments shown.
60% of R is 3 of the segments shown.
100% of R is 5 of the segments shown.

Note: An alternate strategy is to determine 10% of R and then find 100% of R. This (or some other alternate strategy is necessary when 80% of R is given).

- Problem Suggestions: Include percents <, =, > 100.

Example: $300\% \text{ of } R =$
R =

Solution Strategy: The segment shown is 300 pieces.
Split this into 3 segments. One of them is 100% of R.

ACTIVITY CARDS - NUMBER LINE

Number Line Concepts
Percent Sense
PERCENT

I'm showing numbers on a number line. My ruler helps me. I put 100 at 100 mm, 30 at 30 mm and so on.

On your paper draw 5 lines.
Mark 100 mm on each. Show
two numbers on each line.

- 1) 20, 60
- 2) 90, 50
- 3) 95, 35
- 4) 25, 75
- 5) 27, 63

Choose some
numbers between
0 and 100. Show
them on a number
line like I did!

NL - I

NL - II

Point P stands
for a number.
I guessed that
the number is 40.
My ruler says
50 mm. Next
time I'll try
to guess closer.

Guess and check the numbers for these letters. Record in a chart like this

LETTER	GUESS NUMBER	RULER NUMBER
A		
B		
C		

TYPE: Manipulative

ACTIVITY CARDS - NUMBER LINE (PAGE 2)

Can you show numbers greater than 100 and less than 10 on a number line? Try this.

Draw five lines on your paper. Make 0 and 100 on each. Show two numbers on each line.

- | | |
|-----------|-----------|
| 1) 120, 5 | 4) 105, 1 |
| 2) 150, 3 | 5) 125, 6 |
| 3) 200, 8 | |

Guess and check the numbers for the letters below. Record in a chart.

LETTER	GUESS NUMBER	RULER NUMBER
A		
B		

100 can be placed any distance from 0, but once it is placed, 50 comes halfway between 0 and 100.

Notice the ways 50 and 30 are shown below.

Draw five lines. Place 0 and 100 on each line so there are five different distances from 0 to 100.

Show 25, 50 and 75 on each line.

ACTIVITY CARDS - NUMBER LINE (PAGE 3)

Compare your estimates with someone else's. How well do you agree?

Make your own line segments like these. Put letters on the line segments. Give them to your teacher or a classmate.

How well can he guess?

NL - V

NL - VI

Make up a problem.
Give it to a classmate.

Can you find 100?
Use your ruler to
copy these on your
paper. Show 100
on each.

S
I

Equipment: String
Scissors

Licorice laces could be used instead of string and would make a very enjoyable activity for your students.

Activity: 1) Cut a piece of string as long as the line segment below. Lay it on the line segment. Call this string R.

R = _____

2) Cut pieces of string so that their lengths are about the following percents of R. Put each piece of string next to its percent.

50 % of R =

20 % of R =

80 % of R =

100 % of R =

200 % of R =

150 % of R =

3) Write the answers on your paper:

- Which string is the longest? _____ % of R
- Which string is the shortest? _____ % of R
- Are there two strings which are the same length? If yes, which two? _____, _____

Students could compare answers and then check with the teacher or with a prepared key, or students could use the elastic percent approximator to check their answers.

TYPE: Manipulative

Percents of Rectangles

TEACHER IDEAS

Area Model*
Percent Sense
PERCENT

E
S
1

The suggestions below apply the ideas used in *Percents of Line Segments* to rectangles. The suggestions can be developed on a blackboard, overhead or on dittoed sheets.

- I. A rectangle (R) is given. The student is asked to draw N% of the rectangle. Reasonable (but not exact) answers are expected.

Example:

$$R = \boxed{} \quad 50\% \text{ of } R = \quad 200\% \text{ of } R =$$

Solution Strategies:

- One possibility is to split R into 10 equal, vertical parts. Each part is 10% of R (since each part would contain 10 of the 100 equal pieces). 5 of the parts are needed for 50% of R. 20 are needed for 200% of R.
- Some students might reason as follows: "If R were 100 equal pieces, 50% of R would be 50 of those pieces. Therefore, 50% of R is $\frac{1}{2}$ of R. 200% of R would be 200 of the pieces. So, 200% of R is two R's.
- Another strategy is to imagine a number line at the base of the rectangle.

Example:

- II. A reference rectangle is given (R). The student is asked to estimate what percent various rectangles are of R.

Example:

$$R = \boxed{} \quad \text{--- \% of } R = \boxed{} \quad \text{--- \% of } R = \boxed{} \boxed{}$$

Solution Strategies:

- Split R into 10 equal, vertical parts. Each part is 10% of R. The first rectangle is about 1 of these parts. Guess 10% (a rough but reasonable guess). The second has about 14 parts--guess 140% (actually 150%).
- Sketch a number line at the base of the rectangle. Place 0 and 100 at the edges of the rectangle. Estimate the number corresponding to the edges of the rectangles in Question 1.

General Suggestions:

- Keep the percents relatively simple. 83% of R is difficult to estimate.
- Accept reasonable answers--or let students give a range.
- Vary the size of the reference square.
- A key could be provided so work can be checked by students.
- See *Rectangle Percents* for a sample student page.

TYPE: Chalkboard/Paper & Pencil

RECTANGLE PERCENTS

Area Model*
Percent Sense
PERCENT

Students will probably use several strategies for estimating these percents. For several suggested strategies see *Principles of Rectangles*.

Estimate these percents.

GEOBOARD PERCENTS

TEACHER DIRECTED ACTIVITY

Area Model
Percent Sense
PERCENT

E
S
I

The geoboard can be used to motivate and reinforce the concept of 50% (4x4 nail geoboard); 50%, 25%, and 75% (3x3 nail and 5x5 nail geoboards); and 20%, 40%, 60%, and 80% (6x6 nail geoboard). If students are not familiar with geoboards, they should first do the readiness activities found in the section on Lab Materials in the resource book, *Number Sense and Arithmetic Skills*.

- 1) 100% Each student could make the largest square possible on the geoboard. This square will be the REFERENCE SET (100% quantity). For example:

- 2) 50% Each student could be asked to make as many different polygons as possible that represent 50% of the geoboard and record the results on dot paper or geoboard record paper.

Note: If the large square represents 100% of the geoboard, and if this square is divided into two congruent polygons, then each polygon will represent 50% of the geoboard.

- a) Polygon

- b) Different implies polygons that are not congruent.

Only one of these shapes should be recorded

- c) The "obvious" 50%-of-the-geoboard polygons are these.

- d) Students could now be shown a demonstration of how the "obvious" polygons can be changed into other polygons that represent 50% of the geoboard.

- e) Students will now have many different polygons that represent 50% of the geoboard. An easy way for teachers to check these polygons is to apply PICK'S LAW. This states that $AREA = \frac{B}{2} + I - 1$ where B is the number of nails in the boundary of the polygon, and I is the number of nails in the interior of the polygon. Using the first example in (d) above,
 $B = 12$, $I = 3$, so $AREA = \frac{12}{2} + 3 - 1 = 8$ (50% of the 5x5 nail geoboard),
 then $B = 16$, $I = 1$, so $AREA = \frac{16}{2} + 1 - 1 = 8$ (50% of the 5x5 nail geoboard).

[A student discovery activity of PICK'S LAW can be found in *The Mathematics Teacher*, May, 1974, p. 431.]

- 3) A similar development can be done with the other percents listed in the opening paragraph.

TYPE: Manipulative

Dot paper or geoboard record paper is needed so the students can record their results. See the next page.

CHANGING PERCENT SHAPES

TEACHER DIRECTED ACTIVITY

Other Reference Sets
Percent Sense
PERCENT

Which of the 2 squares at the right have 50% shaded? Teachers will probably assume that both are 50% shaded but students might not be so sure. The two squares aren't the same size. The shaded areas are not the same. One square is divided into more parts than the other and the numbers of shaded parts are not equal. The next four pages are masters for transparencies which can be used to help students make the transition from a 100 grid as a reference set to percents of figures with different sizes and shapes. The transparencies can be used as a teacher directed activity with the students deciding what needs to be shaded and what numbers to place in the blanks.

50% Transparency

The squares on this transparency are the same size. The first square has 100 equal parts, so shading 50% of the square means to shade 50 of the parts. The other squares do not have 100 parts, but since they are the same size, 50% of each square is the same area as was shaded in the first square. After shading 50% of each square and counting the parts, students can see that 50% of 40 is 20, 50% of 20 is 10, 50% of 10 is 5, etc. The statements at the bottom can be answered by referring to an appropriate square above.

10% Transparency

This master is similar to the 50% transparency. The same area is shaded to show 10% of each square and the number of divisions varies from 100 to 20.

30% Transparency

This transparency makes the transition from squares of the same area to figures of different area and shape. The first square has 30 of its 100 equal parts shaded. To shade 30% of the second square the same area can be shaded or 3 out of 10 equal parts. The third figure is a different shape but it has 10 equal parts, so it is logical to shade 3 of the parts to show 30% of the figure. 30% of each of the other figures can be shaded by shading 3 out of 10 equal parts.

55% Transparency

Three percents, 55%, 40%, and 25% are carried through the same transition as described for 30%. The transitions follow this outline:

To shade 55% of a figure

shade 55 out of 100

or 11 out of 20 (same area)

or 11 out of 20 (different figures).

To shade 40% of a figure

shade 40 out of 100

or 4 out of 10 (same area)

or 4 out of 10 (different figures).

PERCENTS - NO MODEL NEEDED

As a Ratio
PERCENT

Can't you do percent problems without using a picture?

Sure!
Look at this.

20% of 25 is ____.

20% → 20 for every 100.
5 for every 25

so 20% of 25 is 5.

Divide both numbers by 4 because
 $100 \div 25 = 4$

Wow! That's neat.
Show me some more.

30% of ____ is 15.

30% → 30 for every 100.

15 for every 50.

so 30% of 50 is 15.

____% of 20 is 8.

8 for every 20.

40 for every 100 → 40%

so 40% of 20 is 8.

MULTIPLY
BY 5.

DIVIDE BY
2.

Of course, you could draw a picture to see if your answers look right.

Do these problems.

A) 48% of 25 is ____.

D) 50% of ____ is 1.

G) ____% of 10 is 8.

B) 83% of 100 is ____.

E) 40% of ____ is 8.

H) ____% of 50 is 21.

C) 2% of 50 is ____.

F) 90% of ____ is 9.

I) ____% of 4 is 3.

TYPE: Paper & Pencil/Transparency

5 for every 2000
1 for every _____
_____ for every 100

6) A $\frac{1}{6}$ -cup serving of rice has $\frac{1}{2}\%$ of the minimum daily requirement of Vitamin C. How many cups would you have to cook in order to have enough Vitamin C for one day? _____

7) Many clothing labels say, "Less than 1% shrinkage." If the actual shrinkage is $\frac{1}{2}\%$, how much is lost if you wash 100 yds. of cloth? _____

SOLVING PERCENT EXERCISES BY THE PROPORTION METHOD

TEACHER PAGE

Using Proportion to Solve
Percent Exercises
As a Ratio
PERCENT

Almost all exercises involving percent can be solved by using a proportion format, $\frac{\text{is number}}{\text{of number}} = \frac{\text{percent number}}{100}$. Many words can be used to describe the terms of the proportion, but these pages will emphasize the use of "is," "of" and "percent." So the proportion format to be used is

$$\frac{\text{is number}}{\text{of number}} = \frac{\text{percent number}}{100}$$

One advantage of this method is that only one format is needed to solve percent exercises, rather than three; $p = br$, $b = \frac{p}{r}$, $r = \frac{p}{b}$. Another advantage is that the percent need not be converted to a fraction or a decimal. The use of the form $\frac{\text{percent number}}{100}$ allows a student to write 3.4% as $\frac{3.4}{100}$. Obviously, students will need the skills for computing with fractions and decimals.

For those teachers who have used the ratio method of the previous pages for solving percent exercises, the proportion method can be motivated by examining these examples.

(1) 50% of 40 is ? .

50% means 50 out of 100

or 1 out of 2

or 20 out of 40

(2) 15 is what percent of 60?

15 out of 60

5 out of 20

25 out of 100

$$\text{of} \rightarrow \frac{20}{40} = \frac{50}{100} \leftarrow \text{of}$$

$$\text{of} \rightarrow \frac{15}{60} = \frac{25}{100} \leftarrow \text{of}$$

These examples emphasize that the "of terms" become the denominators of the proportion.

Students will probably need practice in converting exercises to the proportion method. A worksheet of "set 'em up, but don't solve 'em" would be appropriate. It is easiest to first write the "percent number," then the "of number" and finally the "is number." For example,

$$\text{What number is 30\% of 90?} \quad \frac{? \text{ (3rd)}}{90 \text{ (2nd)}} = \frac{30 \text{ (1st)}}{100}$$

TYPE: Paper & Pencil

(a) 50% of 60 is ?

(b) ? is 50% of 60

$$\frac{?}{60} = \frac{50}{100}$$

(c) What number is 50% of 60?

(d) 50% of 60 is what number?

(e) What is the discount if a \$60 pantsuit is marked down 50%?

Emphasize that the "of number" is always written behind the word "of," but the "is number" may be written before or after the word "is." For example, 35 is 50% of 70 or 50% of 70 is 35.

Examples of percent exercises solved using the proportion method.

(1) What percent of 25 is 20? $\frac{\text{is } \#}{\text{of } \#} = \frac{\text{percent } \#}{100} \rightarrow \frac{20}{25} = \frac{?}{100}$

$$20 \times 100 = 25 \times ?$$

$$2000 = 25 \times ?$$

$$80 = ?$$

(2) Find $4\frac{1}{2}\%$ of 200. $\frac{\text{is } \#}{\text{of } \#} = \frac{\text{percent } \#}{100} \rightarrow \frac{?}{200} = \frac{4\frac{1}{2}}{100}$

$$? \times 100 = 200 \times 4\frac{1}{2}$$

$$? \times 100 = 900$$

$$? = 9$$

(3) 3.3% of what number is 99? $\frac{\text{is } \#}{\text{of } \#} = \frac{\text{percent } \#}{100} \rightarrow \frac{99}{?} = \frac{3.3}{100}$

$$99 \times 100 = ? \times 3.3$$

$$9900 = ? \times 3.3$$

$$3000 = ?$$

(4) An airline ticket costs \$400 not including tax. Find the tax if the tax rate is 5%.

Restated: 5% of \$400 is ?. $\frac{\text{is } \#}{\text{of } \#} = \frac{\text{percent } \#}{100} \rightarrow \frac{?}{400} = \frac{5}{100}$

$$? \times 100 = 400 \times 5$$

$$? \times 100 = 2000$$

$$? = 20$$

R =

The exercises shown are suggestions. Choose appropriate exercises for your class. Write your exercises in #2 pencil and it will ditto well.

In each grid shade the
amount shown below.

30% of R

$\frac{1}{5}$ of R

.03 of R

$\frac{1}{25}$ of R

13% of R

$\frac{3}{4}$ of R

.78 of R

3% of R

TYPE: Paper & Pencil

1. Have students express each shaded region in two other ways, e.g., $30\% = .30 = \frac{3}{10}$.

2. Have students compare shaded regions and order the amounts from smallest to largest.

F, D & P

A SHADED TRIO

Grid Model
As a Fraction/Decimal
PERCENT

Write equivalent forms
for the shaded part of R.

Write the fractions
in simplified form.

TYPE: Paper & Pencil
IDEA FROM: Project R-3

PERCENTS WITH RODS & SQUARES - II

Grid Model
As a Fraction/Decimal*
PERCENT

Equipment: Orange and white Cuisenaire Rods.

Activity:

1. Use the orange rods to cover $\frac{1}{2}$ of the square.

How many did you use? _____

What percent of the square did you cover? _____

2. Use the white rods to cover $\frac{3}{100}$ of the square.

How many did you use? _____

What percent of the square did you cover? _____

3. Use orange and white rods to find the corresponding percents and decimals for these fractions.

Fraction of the square	Percent of the square	Decimal of the square
$\frac{1}{10}$		
$\frac{9}{10}$		
$\frac{3}{10}$		
$\frac{2}{5}$		
$\frac{4}{5}$		
$\frac{1}{2}$		
$\frac{1}{4}$		

Fraction of the square	Percent of the square	Decimal of the square
$\frac{3}{4}$		
$\frac{1}{50}$		
$\frac{1}{20}$		
$\frac{1}{25}$		
$\frac{13}{100}$		
$\frac{3}{1}$		
$\frac{217}{100}$		

TYPE: Manipulative

PERCENTS WITH RODS & SQUARES - III

Grid Model
As a Fraction*
PERCENT

Shading squares on a 100 grid could also be used for this concept.

Equipment: 100 white Cuisenaire Rods
or 100 cubes

Activity:

1. a) Use the rods to completely cover the square.
1 rod will cover ___% of the square.
- b) Can you use the rods to exactly cover $\frac{1}{3}$ of the square? _____
- c) Use the rods to cover approximately $\frac{1}{3}$ of the square.
Hint: Divide the 100 rods into three equal groups.
- d) How many rods in each group?
Are there any rods left over? _____
- e) $\frac{1}{3}$ of the square $\approx$ ___% of the square.

2. Find an approximate percent to correspond to each fraction.

Fraction	Approximate Percent		Fraction	Approximate Percent
$\frac{1}{6}$		 Section the square into 8 equal pieces with as little as possible leftover. Cover 3 of the equal pieces.	$\frac{2}{3}$	
$\frac{1}{8}$			$\frac{3}{8}$	
$\frac{1}{11}$			$\frac{5}{8}$	
$\frac{1}{7}$			$\frac{4}{3}$	
$\frac{1}{9}$			$\frac{5}{3}$	

These percents will be exact if the student realizes one of 8 equal pieces should have $12\frac{1}{2}$ squares. He might, however, give 36% for $\frac{3}{8}$ and 132% for $\frac{4}{3}$.

PERCENT WITH RODS & METRES - II

Number Line Model
As a Fraction/Decimal*
PERCENT

EQUIPMENT: METRE STICK
ORANGE AND WHITE CUISENAIRE RODS

ACTIVITY:

1. AN ORANGE ROD IS WHAT PERCENT OF A METRE? _____

WHAT DECIMAL PART OF A METRE? _____

WHAT FRACTIONAL PART OF A METRE? $\frac{1}{10}$

2. A WHITE ROD IS WHAT PERCENT OF A METRE? _____

WHAT DECIMAL PART OF A METRE? $.01$

WHAT FRACTIONAL PART OF A METRE? _____

3. MAKE THIS CHART ON YOUR PAPER, FILL IN THE BLANKS.

See Percent with Rods & Metres - I
in Percent Sense.

PERCENTS WITH RODS & METRES - III

Number Line Model
As a Fraction/Decimal*
PERCENT

The rods are not necessary for conversion, but they help students visualize $\frac{2}{5}$ of a metre, 40% of a metre, etc.

EQUIPMENT: METRE STICK

ORANGE AND WHITE CUISENAIRE RODS

ACTIVITY: THE LENGTH OF AN ORANGE ROD IS $\frac{1}{10}$ OR .1 OR 10% OF A METRE.

THE LENGTH OF A WHITE ROD IS $\frac{1}{100}$ OR .01 OR 1% OF A METRE.

$$\frac{1}{10} = \frac{10}{100} \text{ AND } .1 = .10$$

MAKE THIS CHART ON YOUR PAPER. FILL IN THE BLANKS. THE RODS CAN HELP THE DECIMALS, FRACTIONS AND PERCENTS MAKE SENSE!

EXAMPLE:

FRACTION OF A METRE	# OF ORANGE RODS USED	# OF WHITE RODS USED	DECIMAL PART OF A METRE	PERCENT OF A METRE
$\frac{1}{10}$	1	0	.1	10%
$\frac{2}{10}$				
$\frac{3}{10}$				
$\frac{4}{10}$				
$\frac{1}{2}$				
$\frac{1}{5}$				
$\frac{2}{5}$				
$\frac{3}{5}$				
$\frac{1}{4}$				
$\frac{3}{4}$				
$\frac{1}{20}$				
$\frac{1}{25}$				
$\frac{2}{25}$				
$\frac{1}{2}$				

TYPE: Manipulative

A solution strategy for $\frac{1}{20}$:

$\frac{1}{20}$ means 1 out of 20 equal parts,
which means 5 cm or $\frac{5}{100} = .05 = 5\%$

A pantsuit is marked $\frac{1}{3}$ off. What percent is this? _____

A loan has an annual interest rate of 18%. What decimal is this? _____

The purchase of a new stereo requires 25% down. What fraction is this? _____

TPPF: Paper & Pencil
IDEA FROM: C.O.L.A.M.D.A.

You can develop a similar activity using percents greater than 100%.

PIANOS ARE HEAVY!

As a Fraction
PERCENT

Decode the riddles by writing the letter above the correct answer.

(1) Change each of these to a fraction in simplest form.

A = 50% = _____	L = 4% = _____	A = 5% = _____
T = 30% = _____	O = 10% = _____	R = 90% = _____
M = 75% = _____	I = 25% = _____	N = 35% = _____
	F = 20% = _____	

What do you get when you push a piano down a mine shaft?

$\frac{A}{\frac{1}{2}}$ $\frac{F}{\frac{1}{5}}$ $\frac{L}{\frac{1}{25}}$ $\frac{A}{\frac{1}{20}}$ $\frac{T}{\frac{3}{10}}$ $\frac{M}{\frac{3}{4}}$ $\frac{I}{\frac{1}{4}}$ $\frac{N}{\frac{7}{20}}$ $\frac{O}{\frac{1}{10}}$ $\frac{R}{\frac{9}{10}}$

(2) Change each of these to a percent.

R = $\frac{2}{5}$ = _____	A = $\frac{3}{25}$ = _____	F = $\frac{17}{20}$ = _____
A = $\frac{41}{50}$ = _____	T = $\frac{1}{100}$ = _____	A = $\frac{1}{50}$ = _____
M = $\frac{4}{5}$ = _____	O = $\frac{6}{6}$ = _____	L = $\frac{3}{5}$ = _____
		J = $\frac{13}{100}$ = _____

What do you get when you push a piano through an officer's club?

$\frac{A}{12\%}$ $\frac{F}{85\%}$ $\frac{L}{60\%}$ $\frac{A}{82\%}$ $\frac{T}{1\%}$ $\frac{M}{80\%}$ $\frac{A}{2\%}$ $\frac{J}{13\%}$ $\frac{O}{100\%}$ $\frac{R}{40\%}$

SUSPENDED FOR TEN DAYS

As a Decimal*
PERCENT

Why was the "A" student in a cannibal school suspended for ten days?

To find the answer circle the true equations in each row. Over each equation is a number and a letter. The number tells you in which box at the bottom of the page to put the letter. Each row contains only three correct statements.

6-T	15-A	20-C	23-I	14-H
4% = .04	2.9% = .29	8% = .08	77.3% = 77.3	18.6% = .186
21-H	7-E	13-P	4-B	21-O
16.3% = .163	5% = .5	40% = .4	2.5% = .025	3% = .003
9-S	11-D	20-L	9-R	24-S
2% = .2	1% = .01	92% = 9.2	98.9% = .989	35% = .35
3-E	17-T	10-A	12-U	19-H
3.72% = .0372	.9% = .009	9% = .9	15.2% = .152	1.5% = .15
8-E	16-S	1-S	18-J	5-U
67% = .67	10% = .01	123% = 1.23	16.3% = 1.63	.8% = .008
24-P	18-E	10-E	23-R	17-M
77.3% = 77.3	5% = .05	.2% = .002	97% = .97	2.5% = .29
13-T	22-E	14-W	2-H	19-A
128% = 12.8	.9% = .009	3.2% = .0032	150% = 1.5	.4% = .004
15-E	7-T	12-A	11-N	16-R
7.9% = .079	20% = .2	3% = .3	12.5% = 1.25	256% = 2.56

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24
S	H	E	B	U	T	T	E	R	E	D	U	P	H	E	R	T	E	A	C	H	E	R	S

You may wish to introduce the activity by asking the class to write 15.3% as a decimal. Since 15% = .15 and 16% = .16, 15.3% is between .15 and .16. Also, 15% = .15 = 15 x .01 = 15 x 1%. So 15.3% = 15.3 x 1% = 15.3 x .01 = .153.

Volume Model
As a Fraction/Decimal
PERCENT

SEE-THROUGH DEMONSTRATION

TEACHER DIRECTED ACTIVITY

Bring a number of see-through containers to class and display them on a table where all students can see them. (i.e., glass cylinders, test tubes, glass or plastic cubical containers, plastic pitchers (cylindrical), household measuring cups, drinking glasses, and some odd-shaped glass containers (i.e., vases, spherical glass bowls, cones, wine glasses).

A number of concepts can be taught using these containers as visual aids and motivation.

I. Using a large pitcher, pour colored water (or rice or sand) into each container on the table to different levels.

Ask the students to identify the amount of water in each container (as compared to the volume of the whole container). For example, how full is the glass?

Possible responses: $\frac{1}{2}$ full, 50% full, .5 full, 50% empty. The most common response would be $\frac{1}{2}$ full. Encourage students to give equivalent answers in percent and decimal forms.

II. Let the students take an active part in this demonstration by pouring water into the containers. For example, select a student(s) to fill each (or one) container approximately $\frac{1}{4}$ full (or 25% full or .25 full).

Why are some containers easier to fill to the approximate amount than others? (Discuss visual illusions of odd-shaped containers.)

SEE-THROUGH DEMONSTRATION (CONTINUED)

Continue to select students to take part in the demonstration,

i.e., fill the glass cylinder 50% full.

fill the test tube $\frac{1}{3}$ full.

fill the plastic pitcher .75 full.

fill the glass cubical container 90% full.

fill the measuring cup $\frac{2}{3}$ full.

If a student fills a container approximately 75% full, and other students disagree with the approximation, it may be necessary for students to "check" the approximation by other means than "eye-balling" (guessing by looking). Students can check actual volume of odd-shaped containers (vases, cones, spherical bowls) by using standard containers that display volume measurements in cups, $\frac{1}{4}$ cup, tablespoons, millilitres or litres. Other strategies for checking answers: 1. Put masking tape along side of container and mark intervals on the tape with a ruler. 2. Use the elastic percent approximation and stretch to find the percent of water in the container. 3. Make a "dipstick" to measure level of the water compared to the height of the container. See *Make a Dipstick* in Scaling. The demonstration could be reversed by having students pour from full containers to leave them x% empty.

ALTERNATIVES TO THIS TEACHER DEMONSTRATION:

The teacher can provide an overhead transparency with outlines of empty glasses (or test tubes or aquarium tanks or other see-through containers). The demonstration is in 3-dimensions; the overhead transparency would abstract the concept to 2-dimensions.

Using 2-D pictures of containers, students can approximate the fraction and corresponding percent of liquid in the container in two ways:

Let students guess the fraction, percent, and decimal amount of liquid in each container pictured.

$$25\% = \frac{1}{4} = .25 \quad \frac{9}{10} = .9 = 90\% \quad 60\% = .6 = \frac{3}{5} \quad \frac{1}{2} = \underline{\hspace{1cm}} \quad \frac{1}{5} = \underline{\hspace{1cm}}$$

Let students color in the amounts on an overhead transparency or shade drawings on the chalkboard. A worksheet or an activity card could provide a number of pictures of containers to be "filled" to the given amount. Ask students to identify the amount of water "filled in" with fraction, percent, and decimal equivalencies.

ONLY THE NAMES HAVE BEEN CHANGED

TEACHER IDEAS

Each activity below was presented earlier to help students develop a "sense of percent." However, the activities can be adapted to develop informal equivalences between fractions, decimals and percents. Some suggestions for each page are provided.

1. Fill it Up!

Alternative dice may be substituted.

#4 marked $\frac{1}{100}$, $\frac{1}{5}$, $\frac{1}{4}$, $\frac{1}{25}$, $\frac{1}{20}$
#5 marked .01, .05, .13, .10, .03, .09

2. Percents of Sets - I

A similar page could be designed which asks students to circle the given part of each set. The part may be expressed as a decimal, fraction or percent.

2

Percents of Sets - I

Circle 20% of this set of triangles.

There are 25 Δ 's. I need to find 20% of 25.

20% means 20 out of 100 or 5 out of 25. So, I'll circle 5 triangles.

Circle the same percent of each set below.

(A) 20% of this set

(B) 20% of this set

(C) 20% of this set

(D) 20% of this set

(E) 20% of this set

(F) 20% of this set

(G) 20% of this set

(H) 20% of this set

(I) 20% of this set

(J) 20% of this set

(K) 20% of this set

(L) 20% of this set

(M) 20% of this set

(N) 20% of this set

(O) 20% of this set

(P) 20% of this set

(Q) 20% of this set

(R) 20% of this set

(S) 20% of this set

(T) 20% of this set

(U) 20% of this set

(V) 20% of this set

(W) 20% of this set

(X) 20% of this set

(Y) 20% of this set

(Z) 20% of this set

(Hint: 25 out of 100 or 5 out of 25)

3. Changing Percent Shapes

For each picture the students could be asked to express the number of shaded parts compared to the total number of parts as a fraction and as a decimal.

As a Fraction/Decimal
PERCENT

1.

FILL IT UP!

Needed: 2 to 4 players
Game grids
3 dice marked as follows:

#1 marked 15, 25, 75, 185, 215, 335
#2 marked 25, 45, 85, 195, 275, 385
#3 marked 35, 55, 205, 135, 65, 175

Rules:
Each player selects a grid to fill up.
Each player rolls #1 die. Highest percent goes first.
Each player rolls all dice and selects one amount to shade on his grid.
If all amounts are too large, no part may be shaded.
Winner is the first player to exactly fill his grid.

3.

CHANGING PERCENT SHAPES

Which of the 2 squares at the right have 50% shaded? Teachers will probably assume that both are 50% shaded but students might not be so sure. The two squares aren't the same size. The shaded areas are not the same. One square is divided into more parts than the other and the numbers of shaded parts are not equal. The next four pages are masters for transparencies which can be used to help students make the transition from a 100 grid as a reference set to percents of figures with different sizes and shapes. The transparencies can be used as a teacher directed activity with the students deciding what needs to be shaded and what numbers to place in the blanks.

100% Transparency
The squares on this transparency are the same size. The first square has 100 equal parts, so shading 50% of the square means to shade 50 of the parts. The other squares do not have 100 parts, but since they are the same size, 50% of each square is the same area as was shaded in the first square. After shading 50% of each square and counting the parts, students can see that 50% of 40 is 20, 50% of 20 is 10, 50% of 10 is 5, etc. The statements at the bottom can be answered by referring to an appropriate square above.

10% Transparency
This master is similar to the 50% transparency. The same area is shaded to show 10% of each square and the number of divisions varies from 100 to 20.

50% Transparency
This transparency shows the transition from squares of the same area to figures of different area and shape. The first square has 30 of its 100 equal parts shaded. To shade 50% of the second square the same area can be shaded or 3 out of 10 equal parts. The third figure is a different shape but it has 10 equal parts, so it is logical to shade 3 of the parts to show 50% of the figure. 50% of each of the other figures can be shaded by shading 3 out of 10 equal parts.

55% Transparency
Three percents, 55%, 40%, and 25% are carried through the same transition as described for 50%. The transitions follow this outline:

To shade 55% of a figure shade 55 out of 100 or 11 out of 20 (same area) or 11 out of 20 (different figures).
To shade 40% of a figure shade 40 out of 100 or 4 out of 10 (same area) or 4 out of 10 (different figures).

(PAGE 2)

4

GUESS and Check

First, approximate the percent of R that is shaded. Then, using the transparent 100 grid, find the exact percent of R that is shaded.

Guess: _____ % of R shaded Guess: _____ % of R shaded Guess: _____ % of R shaded
 Exact: _____ % of R shaded Exact: _____ % of R shaded Exact: _____ % of R shaded

THIS IS A HUNDRED GRID.

7. Elastic Percent Approximator

Mark a second piece of elastic with the fractions $\frac{0}{1}, \frac{1}{4}, \frac{1}{2}, \frac{3}{4}, \frac{1}{10}, \frac{2}{10}, \frac{3}{10}, \frac{4}{10}, \frac{6}{10}, \frac{7}{10}, \frac{8}{10}, \frac{9}{10}, \frac{1}{1}$ so that $\frac{0}{1}$ corresponds with 0% and $\frac{1}{1}$ corresponds with 100%. Use both pieces of elastic to measure the examples.

THE ELASTIC PERCENT APPROXIMATOR EXTENDED

A piece of elastic can be used to solve or check percent problems. Even though the elastic has limitations due to its stretch or the scale that is being used, it will give good approximations.

A classroom model can be made on the back of a metre stick or a piece of wood from the shop. It should be thick enough to staple the elastic strips on the end and wide enough for the percent scale and the strip (or strips). A good size for the elastic strips is $\frac{3}{16}$ " wide and 30 inches long.

A scale (REFERENCE SET) is drawn on the wood (or on a piece of tape placed on the wood), and all percents will be read from this scale. A convenient length for the scale is 20 inches or 50 centimetres for the percents from 0% to 100% with 2 inches (or 5 cm) for each 10% of the REFERENCE SET. Be sure to extend your scale beyond 100%, as this model will solve problems with percents greater than 100%. The elastic is fastened to the end of the wood (staples work well) and then marked. (See the diagrams above.) Other scales can be used. e.g., a scale from 0-50 could be made to do problems like - 10% of 30 = _____. Note: Do not use staples on the face of the model, as this will affect the uniform stretch of the elastic.

7.

ELASTIC PERCENT APPROXIMATOR

A piece of elastic or a rubber band can be made into a percent calculator for approximating.

You can use:

a) a 3" piece of $\frac{1}{16}$ " elastic (the smaller the width, the more the stretch)

b) a $2\frac{1}{2}$ " - 3" piece of a rubber band that is $\frac{1}{8}$ " - $\frac{3}{8}$ " wide

The students work together to mark the elastic (rubber band). One stretches the material along the scale at the top, while the other marks the divisions on the elastic (rubber band). If the material is wide enough, the left end can be labeled 0%, the middle 50%, and the right end 100%. Note: These labels assume that the part of the elastic with the marks is the reference set (100% quantity).

At this point, the students should experiment with the elastic to see that the marks remain evenly spaced regardless of how much it is stretched. They should be reminded that their answers will be approximate and that each segment represents 10% of the reference set because the reference set (100%) was divided into 10 equal parts.

The next page shows examples of student problems. Depending on your students, you may want to supply separate worksheets on the length, area, and volume concepts or include all three on the same worksheet. It is hoped that students will see that all of a quadrilateral with opposite sides congruent can be shown in two ways and that all of a 6-sided polyhedron with opposite faces congruent can be shown in three ways.

8. The Elastic Percent Approximator Extended

This manipulative can be used to approximate answers to problems like $\frac{5}{8}$ of 140. Using the Percent Bar Sheet, $\frac{5}{8}$ can be converted to about 62%. Then 62% of 140 can be found on the percent approximator. In a similar way, $.34 \times 98$ could be approximated.

GAMES STUDENTS PLAY

TEACHER IDEAS

The following are examples of games found in the resource, Number Sense and Arithmetic Skills, that can be adapted for use in this section of the Ratio, Proportion and Scaling resource. These games will provide drill on fraction, decimal, and percent equivalences.

As a Fraction/Decimal
PERCENT

1. Fractions and Decimals Puzzle

Three games, one with fraction-percent equivalences, one with decimal-percent equivalences and one with all three equivalences, could be constructed using this idea. In order to save the game for future use, the page can be dry mounted and laminated before the page is cut into sections.

2.

2. Decimal Niddy Griddy I

This self-checking game could be adapted by using either percent-fraction equivalences or percent-decimal equivalences. Again, dry mounting and laminating the pieces before cutting them out will preserve the game for future use.

TYPE: Game

GAMES STUDENTS PLAY (CONTINUED)

3. Fraction and Decimal Concentration

This game can be played with 5 sets of cards, each set showing 4 equivalent expressions, e.g.,

$\frac{1}{2}$	.5	50%	$\frac{50}{100}$
---------------	----	-----	------------------

4. Monster Decimals

The game deck includes 12 sets of 4 cards. One of the 4 cards can be written as a percent expression. The other rules will remain the same.

MONSTER DECIMALS

This game is played in much the same way as the card game Old Maid.

NUMBER OF PLAYERS: 2 to 6

MATERIALS: 49 cards - 12 groups of 4 cards each, and the monster card. Each group consists of 4 equivalent expressions. Here are some sample groups:

$\frac{3}{4}$	75%	750	
$\frac{5}{10}$	25		
3	THIRTY	3	

RULES:

Deal all the cards. Each player discards pairs of cards showing equivalent numbers. If the player has 1 card that match he may discard only two of them. When this is completed each player has only unmatched cards in his hand.

Next, without looking, the dealer takes one card from the hand of the player on her right. If that card matches a card in her hand she may discard the pair faceup.

Play continues this way around the circle to the right. As the cards move from player to player they will eventually be paired and discarded - except for the monster card.

When a player discards all his cards he is a winner and drops out of the play.

The loser is the one who last holds the monster card.

5. More Dominoes

Percent equivalences can be substituted on one end of several dominoes.

3.

FRACTIONS AND DECIMALS CONCENTRATION

For this game you will need 20 cards in pairs. Each pair will contain one fraction card and one decimal card.

SAMPLE PAIRS:

$\frac{1}{2}$	$\frac{3}{4}$	$\frac{5}{2}$	$\frac{3}{5}$	$\frac{1}{1}$
.5	.75	2.5	.6	.125

The first time students play this game be sure to use only fractions that have terminating decimal forms.

Do not use fractions such as $\frac{1}{3}$ or $\frac{1}{4}$.

RULES: Place the cards facedown in to 4 rows of 5 cards each.

The first player turns any two cards faceup. If the two cards match (are equivalent), the player keeps them and turns over two more cards. If the two cards do not match, they are turned facedown again in the original dealt position.

Play proceeds to the left until all cards have been paired.

WINNER: The player with the most cards at the end of the game.

STRATEGY: Players should try to remember the placements of the cards as they are turned faceup.

5.

More Dominoes

RULES: PLACE ALL DOMINOES FACE DOWN. EACH PLAYER DRAWS SIX DOMINOES. LARGEST DOUBLE GOES FIRST. YOU CAN PLAY IF YOU HAVE A DOMINO THAT MATCHES ONE HALF A DOMINO ALREADY PLAYED. IF YOU CAN'T PLAY YOU MUST PULL FROM THE FACE-DOWN DOMINOES UNTIL YOU GET ONE THAT CAN BE PLAYED. WHEN ALL THE DOMINOES HAVE BEEN PULLED, A PLAYER LOSES A TURN IF HE CANNOT PLAY. THE FIRST PLAYER TO PLAY ALL OF HIS DOMINOES IS THE WINNER.

.1	two-tenths $\frac{2}{10}$	$\frac{3}{10}$
.20	.30	three tenths .40
$\frac{1}{10}$	.2 five-tenths	.3
.10	$\frac{2}{5}$	$\frac{3}{10}$
one-tenth $\frac{1}{10}$	$\frac{6}{10}$	.5
$\frac{1}{10}$	.6	.60 $\frac{3}{5}$
$\frac{4}{10}$ four-tenths	.4	.50 $\frac{5}{10}$
		six-tenths

MAKE A PERCENT BOOK

As a Fraction/Decimal
PERCENT

Materials needed: Deck of 52 cards consisting of 13 sets of 4 cards, 12 sets of equivalences, and 1 set of wild cards

WILD CARD

SUGGESTED EQUIVALENCES

5%	$\frac{5}{100}$	.05	$\frac{1}{20}$
10%	$\frac{10}{100}$	.1	$\frac{1}{10}$
$12\frac{1}{2}\%$	$\frac{12\frac{1}{2}}{100}$	.125	$\frac{1}{8}$
20%	$\frac{20}{100}$	.2	$\frac{1}{5}$
25%	$\frac{25}{100}$	.25	$\frac{1}{4}$
30%	$\frac{30}{100}$	.3	$\frac{3}{10}$
$33\frac{1}{3}\%$	$\frac{33\frac{1}{3}}{100}$	.333	$\frac{1}{3}$
50%	$\frac{50}{100}$	.5	$\frac{1}{2}$
$66\frac{2}{3}\%$	$\frac{66\frac{2}{3}}{100}$	.666	$\frac{2}{3}$
75%	$\frac{75}{100}$	.75	$\frac{3}{4}$
90%	$\frac{90}{100}$	.9	$\frac{9}{10}$
100%	$\frac{100}{100}$	1.00	1
WILD	WILD	WILD	WILD

Rules:

- (1) Each player is dealt 6 cards and the other cards are placed face-down to form a draw pile.
- (2) The object of the game is to form books of four equivalent cards. A book may be started only with a percent card.
- (3) The player to the left of the dealer starts by playing a percent card in the middle of the table and then drawing a card to replace it.
- (4) The next player either (1) plays an equivalent card, (2) starts a new book with a percent card, or (3) plays a wild card. A card is then drawn to replace it. If a player cannot play a card, he loses his turn.
- (5) The player who completes the four-card book keeps the book.
- (6) When the draw pile is gone, the players continue to play cards until no one can make any more plays.

Scoring:

- (1) Add 5 points for each completed book.
- (2) Add 10 points for being the first player to play all his cards.
- (3) Subtract 2 points for each card not played.
- (4) First player to score 100 points wins the game.

TYPE: Game

IDEA FROM: "The Percent Game," The Mathematics Teacher,
Dec., 1974

This deck of cards can be used to play: Fish, War, Slap, Jack (Use the wild cards.), Crazy Eights (Use the wild cards.), or Old Maid (Use one wild card.).

SEARCH & CIRCLE

TEACHER IDEA

As a Fraction/Decimal*
PERCENT

For each grid the reference set is the same.

The student is to construct any true mathematical sentence within the grid by putting in an +, -, x, or ÷ sign and an equal sign, and by enclosing the sentence in a bubble. Statements may be made vertically, horizontally, or diagonally.

Construction of the grid: (see Grids #1, #2 below).

a) Identify the concept(s) you wish to review:

PERCENT, FRACTION, DECIMAL EQUIVALENCES

b) Select specific sentences to be used:

$$10\% + 40\% = 50\%$$

$$50\% \div \frac{1}{2} = 1$$

$$\frac{1}{5} + .14 = 34\%$$

$$\frac{1}{2} - 16\% = .34$$

c) Construct a grid using each sentence (see Grid #1).

d) Fill in the remaining cells with appropriate quantities (see Grid #2).

*1

Purpose: Number grids can be used to stimulate thought and enjoyment on the part of the student and also provide drill. Students who are reluctant to do homework could be challenged by an assignment. "Find as many true sentences as you can using the grid," or "Construct a grid of your own and exchange with a friend."

THE ELASTIC PERCENT APPROXIMATOR EXTENDED

TEACHER IDEA

Using a Percent Calculator
Solving Percent Problems
PERCENT

A piece of elastic can be used to solve or check percent problems. Even though the elastic has limitations due to its stretch or the scale that is being used, it will give good approximations.

A classroom model can be made on the back of a metre stick or a piece of wood from the shop. It should be thick enough to staple the elastic strips on the end and wide enough for the percent scale and the strip (or strips). A good size for the elastic strips is 3/16" wide and 30 inches long.

A scale (REFERENCE SET) is drawn on the wood (or on a piece of tape placed on the wood), and all percents will be read from this scale. A convenient length for the scale is 20 inches or 50 centimetres for the percents from 0% to 100% with 2 inches (or 5 cm) for each 10% of the REFERENCE SET. Be sure to extend your scale beyond 100%, as this model will solve problems with percents greater than 100. The elastic is fastened to the end of the wood (staples work well) and then marked. (See the diagrams above.) Other scales can be used, e.g., a scale from 0-50 could be made to do problems like - 20% of 30 $\approx$ _____. Note: Do not use staples on the face of the model, as this will affect the uniform stretch of the elastic.

TYPE: Activity

See *Elastic Percent Approximator* for an introductory activity.

THE ELASTIC PERCENT APPROXIMATOR EXTENDED (CONTINUED) SAMPLE PROBLEMS

A) 40% of 140 $\approx$ ____

- 1) Use the bottom scale when the number > 100 .
- 2) Stretch the elastic until 140 is located opposite 100.
- 3) Find 40% and read the answer 56 opposite the 40%.

B) ____ % of 80 $\approx$ 50

- 1) Use the bottom scale when the number ≤ 100 .
- 2) Stretch the elastic until 80 is located opposite 100.
- 3) Find 50 on the elastic and read the answer 62% opposite the 50.

C) 60% of ____ $\approx$ 54

- 1) Stretch the elastic until 54 is located opposite 60%.
- 2) Find the answer 90 opposite 100.

Special Notes:

- 1) Emphasis to the students on why this model works is important. It should be stressed that when a number is placed opposite 100, the distance from 0 to the number has, in effect, been divided into 100 equal parts.
- 2) By setting up one problem, many others are also set up, e.g., 50% of 140 $\approx$ 70 also sets up 60% of 140 $\approx$ 85, 120% of 140 $\approx$ 168, etc.
- 3) A problem that can't be solved because the elastic will not stretch might be solved by using patterns. 25% of 20 can't be done but 25% of 100 $\approx$ 25, 25% of 80 $\approx$ 20, 25% of 60 $\approx$ 15, so 25% of 40 $\approx$ ____ and 25% of 20 $\approx$ ____.

GRID PERCENT CALCULATOR EXTENSIONS

Using a Percent Calculator
Solving Percent Problems
PERCENT

- 1) Attaching another string at A allows comparisons of two problems, e.g., which has the larger percent for an answer?

A) $\frac{\quad}{\quad}\%$ of 80 $\approx$ 30 B) $\frac{\quad}{\quad}\%$ of 50 $\approx$ 25

- 2) Percents greater than 100% can be worked by two methods.

A) 160% of 70 $\approx$ $\frac{\quad}{\quad}$.
100% of 70 is 70,
so the student
can find 60% of
70 on the grid
and add. (See
the solid line.)

B) 160% of 70
will be
twice 80%
of 70, so
the student
can find
80% of 70
on the grid
and double.
(See the
dotted line.)

Problem A $\rightarrow$ $\leftarrow$ Problem B

- 3) Percents greater than 100% can also be done by changing the percent scale. You could either extend the percent base line or relabel the percent line using intervals of 20.

- 4) Percents less than 1% can be done by relabeling the percent line using intervals of .1.

- 5) Save the grid percent calculators to be used in later activities as an aid in checking the reasonableness of answers.

LAKE & ISLAND BOARD

Using a Model
Solving Percent Problems
PERCENT

TEACHER IDEAS

This is a scale drawing of a "Lake and Island" board. To construct the board cut a 30 cm square from colored railroad board. Enlarge the pattern 2 to 1. Clip the enlargement to the board and perforate the corners of each island with a compass point. Cut the islands from poster paper of contrasting color and use the compass marks to help glue the islands to the board. For durability laminate.

Students can determine the size of each island by using centimetre cubes or a transparent centimetre grid.

- I. Use Island C as the reference set. What percent of C is each of the following? Estimate first.

Island A _____

Island E _____

Island I _____

Island B _____

Island F _____

Island J _____

Island C _____

Island G _____

Island K _____

Island D _____

Island H _____

Change the reference set. If Island J is the reference set, what percent of J is Island K? E? F? D? A?

- II. Use the entire board as the reference set.

(a) What percent of the board is water, islands?

(b) If a woman parachutes from a plane over the area what are her chances of landing on Island A?

TEACHER DIRECTED ACTIVITY

PERCENT APPLICATION	FRACTIONS	FRACTION-PERCENT EQUIVALENCES
FRACTION-DECIMAL EQUIVALENCES	PERCENT CALCULATIONS	GUESS WHAT?
DECIMALS	PERCENT SENSE	WHOLE NUMBERS

- I. To prepare the game sheet construct a tic-tac-toe grid on an $8\frac{1}{2}$ " by 11" transparency. Select nine categories depending on which concepts you wish to review and write them in the squares. The game sheet pictured to the right might be used for percent drill and a review of fractions, decimals and whole numbers.

Construct twelve small transparent squares, six labeled with an "X" and six labeled with an "O", to be used as markers on the game sheet.

- II. For each of the nine categories listed on the game sheet prepare five or six problems on 3 by 5-inch cards. The "guess what" category could be a non-math related question on current events.

- III. Use the coordinated seating chart to divide the class into two teams. The sketch on the right depicts a classroom with 36 students arranged in rows.

Construct two spinners or dice so that you can randomly select students on either team.

TEAM 1

A1	A2	A3	A4	A5	A6
B1	B2	B3	B4	B5	B6
C1	C2	C3	C4	C5	C6
A1	A2	A3	A4	A5	A6
B1	B2	B3	B4	B5	B6
C1	C2	C3	C4	C5	C6

TEAM 2

- IV. To begin the game each team chooses a captain. The captain's job is to select the category from which the team will be presented a problem. Spinners (dice) determine the person on the team to answer the problem. If the answer is incorrect, the same problem is given to a member of the opposing team. When someone does correctly answer the problem, one of the team's markers is placed over the appropriate square on the game board. The captain for the opposing team then selects another category and the play continues.

The game is won by the team that gets three of their markers in a row or has the most markers on the board when all categories are covered.

INTERESTING?

YOU CAN BANK ON IT!

Finding Amount of Interest
Solving Percent Problems
PERCENT

Jim put \$50 per month in a savings account from money earned on his paper route. If the interest rate was 5% per year, how much interest did Jim earn?

Think: $\$50 \times 12 \text{ months} = \$600$ per year
5% means \$5 for every \$100, so the interest was $\$5 \times 6$ or \$30.

Debbie put all of her extra money earned on her paper route in the bank. Last year this was \$738.20. At 5% how much interest did Debbie earn?

Think: 5% means \$5 for every \$100, so Debbie's interest was slightly more than $\$5 \times 7$ (\$35).

To keep accurate records Debbie needed to know exactly how much interest she earned. Since 5% means 5 out of 100 or .05, she multiplied $.05 \times \$738.20$ and got \$36.91 interest.

Use your percent sense to approximate the amount of money earned from each of these savings accounts. Then change the percent to a decimal and multiply to get the actual interest.

SAVINGS	INTEREST RATE PER YEAR	INTEREST APPROXIMATION	ACTUAL INTEREST EARNED
\$ 900	5 %		
\$ 589	5%		
\$1000	4%		
\$1314.50	6%

AT THAT PRICE, I'LL BUY IT

Find Amount of Discount
Solving Percent Problems
PERCENT

Donna wishes to buy a stereo. The Turntable Tower has a \$400 set of stereo equipment that was marked 15% off. To find the amount of the discount Donna thought

15% means \$15 for every \$100, so $15 \times 4 = \$60$ off.

Sue looked at a stereo set costing \$279 that was marked down 20%. She thought, "20% means \$20 for every \$100, so the stereo is marked down about \$60 (20×3)."

To know the actual discount Sue wrote 20% as .20 and multiplied $.20 \times \$279$ to get a discount of \$55.80.

Use your percent sense to approximate the amount of these discounts. Then change the percent to a decimal and multiply to find the actual discount.

ITEM	COST	PERCENT DISCOUNT	APPROXIMATE DISCOUNT	ACTUAL DISCOUNT
STEREO	\$ 600	15%		
AM-FM RADIO	\$ 49	10%		
ELECTRIC GUITAR	\$ 189	20%		
10-SPEED BIKE	\$ 200	10%

TEACHER DIRECTED ACTIVITY

Which letter of the alphabet occurs most frequently in printed material?

(The following is written as an individual activity but can be done in a two-person group.)

- 1) Each student chooses a book.
- 2) Each student then selects five lines of print and keeps a tally to count how many times each letter occurs. If graph paper is used, and a square shaded for each occurrence of a letter, a bar graph will be constructed.

- 3) To compile the results several methods can be used.
 - a) Each student can report his most frequent letter to the class, and a tally on the blackboard can be kept.
 - b) A large bar graph can be constructed on the bulletin board, and each student can shade in his results. The large bar graph may need to be scaled to make the size manageable. For example, 1 square on the large graph represents 8 squares on each student's graph. If the number of squares for any letter on a student's graph does not divide by 8, have them save the remainder and pool it with the rest of the class. The sum of the remainders can be graphed last. For each letter a ratio that compares the number of occurrences for the letter to the total number of occurrences of all letters tallied by the class can be written. The calculator can be used to convert ratio to a percent.
 - c) Each student can examine his own tally for each letter and write the ratio, number of times the letter occurred : total number of letters counted in 5 lines of print. The ratio can also be converted to percent (use the calculator). It may be desirable to have students construct a bar graph depicting the percents.

TYPE: Activity

IDEA FROM: Readings in Mathematics,
Book 2 and Mathematics--
A Human Endeavor

WHO'S #1? (Page 2)

4) Suggestions for analyzing the results.

- Students may wish to compare their tallies with their neighbor's.
- If students have expressed their individual tallies with percents, the percents can be added to see how close the sum is to 100%. Reasons for a variance can be discussed.
- Each student can also compare his individual percents with the percents calculated from the class bar graph. Which set of data is more valid and why? Do the percents for the class bar graph add to 100%?

Extensions:

I. Morse Code

Morse Code is designed for the rapid transmission of messages. Letters are formed by a combination of no more than four dots and/or dashes; digits by a combination of five dots and/or dashes. A dash is formed by depressing the telegraph key for a time unit three times as long as for a dot. The space between dots and dashes in the same letter has the same time unit as the dot. For example,

"L" in Morse code is ". — . ."

* "L" has a time unit length of 9,

Number	Morse Character
1	· — — — —
2	· · — — —
3	· · · — —
4	· · · · —
5	· · · · ·
6	— · · · ·
7	— — · · ·
8	— — — · ·
9	— — — — ·
0	— — — — —

The cost of sending a message depends on the number of time units in the length of the message. This is dependent on how often each letter of the alphabet occurs in the message. To devise a code that is the most economical, those letters that occur most frequently should be represented by code characters that have the shortest time unit lengths.

English Letter (1)	Morse Character (2)	Time Units (3)	Frequency in 100 letters (4)	Time unit length in 100 letters (5) = (3) x (4)
A	· —	5	8	40

V	· · · —	9	1	9
W	· — —	9	1½	13½
X	— · —	11	½	5½
Y	— · — —	13	2	26
Z	— — · ·	11	¼	2¾
Total time unit length of average 100-letter message.			612½	

WHO'S #1? (Page 3)

Have each student create his own "Morse code" based on the percent frequency from his individual tally. For a more efficient code the percent frequency from the large bar graph could be used by the entire class.

The table lists the Morse code character for each letter of the alphabet and gives the total time unit length of the average 100-letter message. Students may wish to compare their codes with the Morse code. Are their codes more efficient than Morse's?

Is the Morse code the most efficient code in terms of economy?

Research projects:

- 1) Is the keyboard arrangement of the typewriter efficient? Were percent frequencies of letters considered in assigning letters to the keys?
- 2) Check the letter frequencies in a Scrabble game. Find the percent frequency for each letter.

NOTE: In creating the Morse code, Samuel F. B. Morse in 1838 counted the letters in a Philadelphia newspaper's typecase to help him assign the characters. Had he assigned the symbols haphazardly, the average message would have cost 25% more.

II. 1) Have students use the percent frequencies of letters based on the large bar graph to estimate the number of letters in each of the following:

- a) E's in 300 letters
- b) W's in 1000 letters
- c) Z's in 3000 letters

2) Consider the sentence: "Pack my box with five dozen liquor jugs."

- a) Find the percent frequency of the letter E in this sentence.
- b) How does this percent compare with the percent frequency for the letter E from the large bar graph?
- c) Check the percent frequencies of other letters in the sentence and compare them with the percent frequencies from the large bar graph.

3) *"This is a highly unusual paragraph. Do you know why? If you try to find out what is odd about it too quickly, it probably won't occur to you. Study it without hurrying, and you may think of what it is. Good luck."*

Have students try to compose a paragraph or sentence without using the letter E!

Gadsby, A
Story of
Over
50,000
Words
Without Using the
Letter E.

HOW TALL WILL YOU GROW ?

Solving Percent Problems
PERCENT

A fairly reliable way of predicting a child's ultimate height from about two years to maturity has recently been discovered. The results are shown in the table.

Example:

Alan is 2 years old and is 90 cm tall. How tall will he be at maturity?

From the table a boy at age two is 50% of his total height.

50% of the total height = 90 cm

$$\frac{50}{100} = \frac{90 \text{ cm}}{?}$$

$$? = 180 \text{ cm}$$

- 1) Calculate your own ultimate height to the nearest centimetre.
- 2) Calculate the ultimate heights to the nearest centimetre of
 - a) A boy 8 years old who is 120 cm tall.
 - b) A girl of 14 years who is 162 cm tall.
 - c) A girl of 5 years who is 104 cm tall.
 - d) A boy of 13 years who is 151 cm tall.
- 3) Calculate the ultimate heights for members of your own family less than 16 years of age.
- 4) Make two bar graphs, one for boys, one for girls, showing the percent of ultimate height for each age. For each find the ages where the "growth spurt" occurs.

At 14 years the table is accurate to 3% for girls, 4% for boys. The error is greater for younger children. Under 2 years the table is not reliable.

STATE THE RATE

Finding Amount of
Sales Tax
Solving Percent Problems
PERCENT

You will need a 1975 or newer almanac and some advertisements from a local newspaper or catalog to do this assignment.

What is the year of your almanac? _____

Use the index to find the page for Taxes (State) -- Sales.

- 1) How many states have a sales tax? _____ (D.C. is not a state.)
- 2) How many states do not have a sales tax? _____
- 3) What percent of the 50 states have a sales tax? _____
- 4) Does your state have a sales tax? _____ If so, what is the rate? _____
- 5) What is the highest rate listed? _____ What state(s)? _____
- 6) What is the lowest rate listed? _____ What state(s)? _____
- 7) Select ten items from the newspaper or catalog, and find their total cost.

- a) Use the tax rate from #5 to find the sales tax on the total cost. _____
- b) Use the tax rate from #6 to find the sales tax on the total cost. _____
- c) Your answer to (a) is how much larger than your answer to (b)? _____
- d) If the tax rate in your state is not the highest or lowest rate, use it to find the sales tax for the ten items.

Extension: Students could compare state sales tax rates and state income tax rates. Do states with a high sales tax rate have a low income tax rate?

CERTAIN GROWTHS ARE BENEFICIAL

TEACHER PAGE

Finding Amount of Interest
Solving Percent Problems
PERCENT

Many kinds of growth occur and are studied in mathematics. Some involve growth by a fixed amount, some by a fixed rate. These two can produce surprisingly different results.

Have students compute the outcome of depositing \$1000 at a bank at a 5% interest rate compounded annually for 20 years and compare it with a deposit of \$1000 increased annually by a fixed amount of interest (\$50.00 = 5% of \$1000) for 20 years.

Tables could be used to organize the results, and a hand calculator would simplify the computation. Interest payments should be rounded to the nearest cent.

COMPOUND INTEREST (fixed rate)

Age of deposit in years	Amount at beginning of year	Interest at 5%	Amount + Interest
1	\$1000.00	\$ 50.00	\$1050.00
2	\$1050.00	\$ 52.50	\$1102.50
3	\$1102.50	\$ 55.13	\$1157.63
4	\$1157.63	\$ 57.88	\$1215.51

SIMPLE INTEREST (fixed amount)

Age of deposit in years	Amount at beginning of year	Fixed amount of interest credited each year
1	\$1000.00	\$ 50.00
2	\$1050.00	\$ 50.00
3	\$1100.00	\$ 50.00
4	\$1150.00	\$ 50.00

Discuss the two outcomes. In the first table the amount of growth each year shares in the growth during the next year.

Suppose that the interest is compounded semi-annually or quarterly. What effect would this have? Some banks compound interest continuously. What does this mean? Investigate the savings plans offered at banks and savings and loan. Which would be the best for short term deposits? long term deposits?

In the bank compound interest amounts are calculated from the formula $A = (1 + \frac{r}{m})^{mt}$ where r is the annual rate of simple interest, t is the time period in years, m is the number of compounding periods in a year. By the use of the formula it can be shown that the effective annual yield of a 7% savings certificate compounded daily for a 365-day year is 7.25% ($A = (1 + \frac{.07}{365})^{365} \times 1 = 1.0725$).

If compounded continuously, the formula used is $A = e^{rt}$ where e is the base of natural logarithms. $A = e^{.07 \times 1} = 1.735$, an effective annual yield of 7.35%.

Thus, a 7% certificate could yield 7.25% or 7.35%.

HIDDEN COSTS IN A HOME

TEACHER DIRECTED ACTIVITY

Finding Percent of Interest
Solving Percent Problems
PERCENT

Time payments allow the consumer the use of an article before he has completely paid for it. In exchange for the convenience the consumer must pay a service charge.

In buying a home few people realize that the interest (service charge) they will pay on the mortgage may amount to more than the money they borrowed. In addition, long term payment plans can increase the total service charge considerably.

Pose the following situation to your class:

You are borrowing \$10,000 to buy a home. The interest rate is 8% each year on the unpaid balance. Only one payment each year is made on the loan. How large would the yearly payment have to be in order to cover the service charge (interest) the first year? If the loan is paid off in 20 years, how much money do you think is paid in interest? If the loan is paid in 30 annual payments, how much interest is paid?

Two tables are provided that give a year by year breakdown of the payment of the loan—one, a twenty-year plan, the other, a thirty-year plan. All amounts are rounded to the nearest dollar.

Hand out the tables or make a transparency for the overhead. The following questions are suggested for discussion.

- 1) For each plan how much is the yearly payment?
- 2) How much of the first payment in each table is used for interest? How much money is still owed at the end of the first year?
- 3) After the tenth payment how much money is still owed?
- 4) Students could draw a bar graph showing the balance owed for each year.
- 5) In paying off the 20-year loan how much money is spent? What is the amount of interest?
- 6) Which loan is the most costly? By how much?
- 7) Why would someone select the more costly plan?

Extension:

Have students select an item(s) they would like to purchase, e.g., stereo, 10-speed, skiing equipment from a local store or mail-order catalogue. Investigate the time payment plan(s) of the store and/or catalogue. Students could organize the results in a table similar to the two mortgage tables. Suppose a credit card were used for the purchase. Discuss the interest charge. How long would it take to pay for the item if \$10 a month was paid? What would the total service charge be?

PERCENT FALLACIES

Finding Percent of Increase/
Decrease
Solving Percent Problems
PERCENT

TEACHER PAGES

Even though many people have an understanding of the concept of percent, they commonly make errors in dealing with successive rates of increase or decrease. For example, they assume that two increases of 10% are the same as one increase of 20%. They also conclude that an increase of 10% followed by a decrease of 10% is the same as no change at all.

Many puzzles have been patterned on the last fallacy. For example:

Mr. Smith bought a car for \$600. He then marked the price up 50% and tried to sell the car. After five unsuccessful months he marked the price down 50% and sold the car. Did Mr. Smith gain, lose or break even on the deal? This question will be answered on the next page.

First, let's examine two increases of 10%. Suppose we start with \$100.

Initial amount = \$100

10% increase = 10% of \$100 = \$10

New total = \$100 + \$10 = \$110

10% increase = 10% of \$110 = \$11

Total = \$121

Increase = \$121 - \$100 = \$21

\$21 = 21% of \$100

Thus, two successive increases of 10% are the same as an increase of 21%.

Similarly, let's look at two decreases of 10%.

Initial amount = \$100

10% decrease = 10% of \$100 = \$10

New total = \$100 - \$10 = \$90

10% decrease = 10% of \$90 = \$9

Total = \$81

Decrease = \$100 - \$81 = \$19

\$19 = 19% of \$100

Two successive decreases of 10% are the same as a decrease of 19%!

TYPE: Paper & Pencil

PERCENT FALLACIES (CONTINUED)

Now let's investigate Mr. Smith's car deal.

Initial cost = \$600
50% increase = 50% of \$600 = \$300
Total cost = \$900
50% decrease = 50% of \$900 = \$450
Selling price = \$900 - \$450 = \$450
Mr. Smith lost \$600 - \$450 = \$150!!

After developing the concept of percent with the student, questions involving the percent fallacies could be used for class warm-ups, group discussions and/or problem-solving activities. Some suggestions are:

- 1) Jill wishes to purchase a ten-speed bike priced at \$200. Since she is a little short of cash, she decides to wait until the bike goes on sale. In July the price is marked down 10%. In August the price is marked down another 10%. If she buys in August, how much will she have to pay for the bike?
- 2) In 1970 the population of the U.S. was about 200,000,000. If the population increases at a rate of 14% every ten years, what will the population be in 1980? 1990? 2000? etc.? What was the population in 1960?
- 3) What single rate of increase is the same as two successive increases of 20%?
- 4) A rancher has a herd of 500 cattle. In the spring he has a 30% increase. In the fall he sells 30% of the herd. Is his herd less than, greater than or equal to 500 cattle?
- 5) Is an increase of 10% followed by a decrease of 10% the same as a decrease of 10% followed by an increase of 10%?
